

DATACOM

DmOS

DATACOM OPERATING SYSTEM

Version 5.0.2

QUICK CONFIGURATION GUIDE

204.4292.16 - January 21, 2020

Contacts

Technical Support

Datacom has available a support portal - DmSupport, to help the customers in use and config of our equipment.

Access to the DmSupport can be made through link: <https://supportcenter.datacom.com.br>

In this site the following are available: firmwares, technical datasheets, config guide, MIBs and manuals for download. In addition, it allows opening of calls for assistance with our technical team.

Telephone Number: **+55 51 3933-3122**

We would like to highlight that our assistance through telephone support is available from Monday through Friday from 08:00 AM through 05:30 PM.

Important: For support assistance 24x7, please request a quotation to our sales department.

General Information

For any other additional information, please visit the <https://www.datacom.com.br/en> or call:

Product Documentation

This document is part of a set of documents prepared to provide all necessary information about DATACOM products.

Software Platform

- **Quick Configuration Guide** - Provides instructions on how to set functionalities in a quick manner in the equipment
- **Troubleshooting Guide** - Provides instructions on how to analyze, identify and solve problems with the product
- **Command Reference** - Provides all the commands related to the product
- **Release Notes** - Provides instructions on the new functionalities, identified defects and compatibilities between Software and Hardware

Hardware Platform

- **Datasheet** - Provides the Hardware and Software technical characteristics of product
- **Installation Guide** - Provides instructions on the procedures covering product installation

The availability of some documents can vary depending on the type of product.

Access <https://supportcenter.datacom.com.br> to locate the related documents or contact the Technical Support for additional information.

Introduction to the document

About this Document

The present document is a set of instructions that provide a quick and objective explanation on the use of the functionalities available in the product. It also covers the initial configs that are generally required immediately after installation of the product.

This document was developed to be used as an eventual source for solution of technical issues, and for this reason its sequential reading is not mandatory. However, if you are setting the equipment and is not familiar with the product, reading of the document since the beginning is recommended.

It is presumed that the individual or individuals that manage any aspect of the product should have the basic knowledge of Ethernet, network protocols and communication networks in general.

Audience

This guide is directed to network administrators, technicians or teams qualified to install, set, plan and maintain this product.

Conventions

To facilitate understanding of the present manual, the following conventions were adopted:

Icons

Icon	Type	Description
	Note	The notes explain in a better manner a detail included in the text.

Icon	Type	Description
	Note	WEEE Directive Symbol (Applicable in the European Union and other European countries with separate collection systems). This symbol on the product or its packaging indicates that this product must not be disposed of with other waste. Instead, it is your responsibility to dispose of your waste equipment by handing it over to a designated collection point for the recycling of waste electrical and electronic equipment. The separate collection and recycling of your waste equipment at the time of disposal will help conserve natural resources and ensure that it is recycled in a manner that protects human health and the environment. For more information about where you can drop off your consumer waste equipment for recycling, please contact your local city recycling office or the dealer from whom you originally purchased the product.
	Warning	This symbols means that, case the procedure was not correctly followed, may exist electrical shock risk.
	Warning	Represents laser radiation. It is necessary to avoid eye and skin exposure.
	Warning	Non-ionizing radiation emission.
	Caution	This symbol means that this text is very important and, if the orientations were not correct followed, it may cause damage or hazard.
	Caution	Indicates that equipment, or a part is ESDS (Electrostatic Discharge Sensitive). It should not be handled without grounding wrist strap or equivalent.

A warning icon requests special attention to the conditions that, if not avoided, may cause physical damages to the equipment.

A caution icon requests special attention to the conditions that, if not avoided, may result in risk of death of serious injury.

4.7.1 VLAN counters configuration	53
4.7.2 Interface counters configuration	54
4.7.3 Verifying Counters	54
5 Users Authentication	56
5.1 Local Users Configuration	56
5.1.1 Creating a new Local User	57
5.1.2 Deleting a Local User	57
5.2 TACACS+ Configuration	57

5.2.1 Configuring a TACACS+ Server	57
5.3 RADIUS Configuration	58
5.3.1 Configuring a RADIUS Server	58
5.4 Authentication Order Configuration	59
5.4.1 Configuring RADIUS with higher priority	59
5.4.2 Configuring TACACS+ with higher priority	59
6 Interfaces	60
6.1 Ethernet Interfaces Configuration	60
6.1.1 Configuring Ethernet Interfaces	60
6.1.2 Configuring Ethernet Interfaces Range	61
6.1.3 Configuring Ethernet Interfaces Description	61
6.1.4 Configuring Ethernet Interfaces MTU	62
6.1.5 Configuring Ethernet Interfaces TPID	62
6.1.6 Configuring a 10Gbps Interface to operate in 1Gbps	63
6.1.7 Verifying Interfaces	64
6.2 Link Aggregation Configuration	64
6.2.1 Configuring a LAG in static mode	64
6.2.2 Configuring a LAG in dynamic mode (LACP)	65
6.2.3 Configuring the load balancing	66
6.2.4 Configuring maximum and minimum number of active links in a LAG	67
6.2.5 Verifying Link Aggregation	68
6.3 Port Mirroring Configuration	68
6.3.1 Configuring Port Mirroring for received traffic	68
6.3.2 Configuring Port Mirroring for transmitted traffic	68
6.3.3 Configuring Port Mirroring for transmitted and received traffic	69
6.4 Link Flap Detection Configuration	69
6.4.1 Configuring Link Flap Detection on Ethernet Interface	69
6.4.2 Verifying Link Flap	70
7 GPON	71
7.1 Basic Operation of GPON	71
7.1.1 Setting the GPON interface	71
7.1.2 Setting the ONUs Authentication Method	72
7.1.3 Discovering the ONUS	73
7.2 GPON Profiles	73
7.2.1 Loading the Default Profiles	73
7.2.2 Bandwidth Profile	74
7.2.3 Line Profile	75
7.2.4 SIP Agent Profile	76

7.2.5 SNMP Profile	76
7.2.6 GEM Traffic Agent Profile	77
7.2.7 Residential Gateway Profile (RG-Profile)	78
7.2.8 TR-069 ACS Profile	79
7.3 GPON Service Type	81
7.3.1 Service VLAN N:1	82
7.3.2 Service VLAN 1:1	82
7.3.3 Service VLAN TLS	82
7.4 Mapping the Service Port	82
7.4.1 Service Port - Transparent	83
7.4.2 Service Port - Replace	83
7.4.3 Service Port - Add	83
7.5 Setting GPON Application	83
7.5.1 Configuring a N:1 Application with ONU bridge	84
7.5.2 Configuring a 1:1 Application with ONU bridge	85
7.5.3 Configuring a TLS Application with ONU router	86
7.6 Automatic Provisioning of ONUs	87
8 Switching	89
8.1 MAC Table Configuration	89
8.1.1 Configuring Aging Time	89
8.1.2 Disabling MAC learning	90
8.1.3 Verifying MAC Address Table	90
8.2 VLAN Configuration	90
8.2.1 Configuring VLAN with Tagged Interfaces	90
8.2.2 Configuring VLAN with Untagged Interfaces	91
8.2.3 Configuring VLAN Translate	92
8.2.4 Configuring QinQ	93
8.2.5 Configuring Selective QinQ	93
8.2.6 Verifying VLAN Configuration	94
8.3 RSTP Configuration	95
8.3.1 Configuring a Basic RSTP	95
8.3.2 Applying RSTP parameters	96
8.3.3 Verifying RSTP	97
8.4 MSTP Configuration	97
8.4.1 Configuring MSTP for load balancing	97
8.4.2 Verifying MSTP	99
8.5 EAPS Configuration	99
8.5.1 Configuring a Basic Ring EAPS	100

8.5.2 Verifying EAPS	101
8.6 ERPS Configuration	101
8.6.1 Configuring a Basic Ring ERPS	102
8.6.2 Verifying ERPS	103
8.7 L2CP Configuration	103
8.7.1 Configuring L2CP in extended mode	104
8.7.2 Configuring L2CP by Specific Protocol	105
8.7.3 Configuring L2CP Extended PDU transparency	105
8.7.4 Verifying L2CP	106
8.7.5 PDUs default behavior in OLT platforms	106
8.7.6 PDUs default behavior in Switch platforms	107
8.8 Loopback Detection Configuration	107
8.8.1 Configuring Loopback Detection for access network	107
8.8.2 Verifying Loopback Detection	108
8.9 DHCP Relay L2 Configuration	108
8.9.1 Verifying DHCP Relay	109
9 IP Services	110
9.1 IP Addresses Configuration	110
9.1.1 Configuring IPv4 addresses	110
9.1.2 Configuring IPv6 addresses	110
9.1.3 Verifying IP Address	111
9.1.4 MTU configuration in L3 interfaces	111
9.2 IPv6 SLAAC Configuration	111
9.2.1 Verifying IPv6 SLAAC	113
10 Routing	114
10.1 Static Routing Configuration	114
10.1.1 Configuring a Default Static Route	114
10.1.2 Verifying Static Routes	115
10.2 VLAN Routing Configuration	115
10.2.1 Configuring a Basic Routing between VLANs	115
10.2.2 Verifying Routes	116
10.3 VRF Configuration	117
10.3.1 Configuring VRF Lite	117
10.3.2 Enabling Route Leaking between VRFs	119
10.3.3 Verifying VRFs	121
10.4 OSPFv2 Configuration	121
10.4.1 Configuring OSPFv2 Point to Point	121
10.4.2 Enabling Prefix-List of OSPFv2 routes	123

10.4.3 Verifying OSPFv2	123
10.5 OSPFv3 Configuration	124
10.5.1 Configuring OSPFv3 Point to Point	124
10.5.2 Verifying OSPFv3	125
10.6 BGP Configuration	126
10.6.1 Configuring a eBGP IPv4 Single Homed	126
10.6.2 Configuring route-maps and IPv4 prefix-lists	128
10.6.3 Configuring a iBGP IPv6 Single Homed	129
10.6.4 Configuring route-maps and IPv6 prefix-lists	131
10.6.5 Configuring BGP Communities	132
10.6.6 Verifying BGP	134
10.7 VRRP Configuration	134
10.7.1 Configuring a VRRPv2 to provide High-Availability	134
10.7.2 Verifying VRRP	136
11 MPLS	137
11.1 LDP configuration	137
11.2 VPWS Configuration	138
11.2.1 Configuring a PW type VLAN VPWS - Case 1	141
11.2.2 Configuring a VPWS with VLAN PW type - Case 2	142
11.2.3 Configuring a VPWS with Ethernet PW type - Case 1	144
11.2.4 Configuring a VPWS with Ethernet PW type - Case 2	144
11.3 VPLS Configuration	146
11.3.1 Configuring a VPLS with Ethernet PW type	150
11.3.2 Configuring a VPLS with VLAN PW type	151
11.3.3 Configuring a H-VPLS	153
11.3.4 Enabling TLS in a VPLS	155
11.4 Enabling FAT in a L2VPN	155
11.5 Verifying L2VPN	155
11.6 L3VPN Configuration	156
11.6.1 Configuring a L3VPN Site-to-Site	156
11.6.2 Configuring a L3VPN Hub and Spoke	159
11.6.3 Configuring BGP between PEs and CEs	163
11.6.4 Enabling AS Override	164
11.6.5 Enabling Allow AS In	165
11.6.6 Configuring OSPF between PEs and CEs	165
11.6.7 Verifying L3VPNs	166
12 Multicast	168
12.1 IGMP Snooping Configuration	168

12.1.1 Configuring IGMP Snooping in GPON Application	168
12.1.2 Verifying IGMP	169
13 QoS	170
13.1 Congestion Control Configuration	170
13.1.1 Configuring WFQ Scheduler	170
13.2 Traffic Shapping Configuration	171
13.2.1 Configuring Rate Limit on Interface	171
13.3 Traffic Policer Configuration	171
13.3.1 Configuring Traffic Policing based on VLAN	172
13.3.2 Configuring Traffic Policing based on PCP	172
13.3.3 Configuring Traffic Policing based on DSCP	173
14 Security	175
14.1 Storm Control Configuration	175
14.1.1 Configuring Storm Control	175
14.1.2 Verifying Storm Control	176
14.2 ACL Configuration	176
14.2.1 Configuring ACL L2 to deny traffic of a VLAN	176
14.2.2 Configuring ACL L3 to deny traffic of IPv4 Address	177
14.2.3 Configuring an ACL for CPU protection	177
14.2.4 Verifying ACLs	178
14.3 Anti IP Spoofing Configuration	179
14.3.1 Configuring Anti IP Spoofing for specific IPv4 and MAC address	179
14.3.2 Configuring Anti IP Spoofing for specific IPv4 address	179
14.3.3 Configuring Anti IP Spoofing for all IPv6 addresses	180
14.3.4 Configuring Anti IP Spoofing for all IPv4 and IPv6 addresses	180
14.3.5 Verifying Anti IP Spoofing	180
14.4 MAC Limit Configuration	181
14.4.1 Configuring MAC Limit on Interface	181
14.4.2 Configuring MAC Limit on VLAN	181
14.4.3 Verifying MAC Limit	181
Legal Note	183
Warranty	183

1 Basic Management

This chapter contains the following sections:

- First login
- Firmware Management
- CLI Overview
- Configuration Management
- Files Management

1.1 First login

1.1.1 Installing and energizing the equipment

Please check the detailed instructions in the equipment **Installation Guide**.

1.1.2 Accessing the equipment using the console port

Accessing the equipment using the console port

Access to equipment CLI can be carried out through the console port. A serial cable is required and a terminal emulator such as Hyper Terminal or similar is needed. The terminal settings should be set as **9600 8N1**.

1.1.3 Accessing the equipment using the out-of-band management port

Accessing the equipment using the out-of-band management port

The equipment CLI can also be accessed through the management port, called MGMT. The MGMT port is an Ethernet port dedicated for management and is not enabled to be used by L2 or L3 protocols.

To access the CLI, a LAN cable should be connected to the MGMT port and an IP address should be configured in the auxiliary PC network card. The equipment default IP address is **192.168.0.25/24**. A SSH application in the auxiliary PC is required to connected to the equipment.

1.1.4 Accessing the equipment for the first time

To login to the equipment for the first time, the **admin** user and **admin** default password must be used.

```
login: admin
Password: admin
Welcome to the DmOS CLI
```

For security purposes, it is highly recommended to change the equipment default password.

Please read the **Users' Authentication** chapter to check how to proceed to change user password.

Using the CLI

The easiest manner to use the command line is simply writing the command and pressing [Enter].

```
# command [Enter]
```

If the command includes also a parameter, the keyword and its arguments should be inserted. The argument specifies how the parameter is changed. Values include numbers, strings or addresses, depending on the keyword. After input of the command [Enter] should be pressed.

```
# command keyword argument [Enter]
```

1.2 Firmware Management

The DmOS has two memory locations for firmware storage. After downloading the firmware the image is saved in the inactive or empty position.

Contact DATACOM Technical Support to check the firmware images available for download and installation according to your product and requirements.

1.2.1 DmOS Software Update

To update the equipment using CLI, PC with TFTP, SCP or HTTP server is required in order to send the firmware image to the equipment. The examples below demonstrate how to update the equipment firmware with file named **build.swu** through server with IPv4 address **192.168.0.1**.

To receive the firmware image from a **TFTP server**, use the following command:

```
request firmware add tftp://192.168.0.1/build.swu
```

To receive the firmware image using **SCP**, use the following command:

```
request firmware add scp://192.168.0.1/build.swu username user password "pass"
```

To receive the firmware image using **HTTP**, use the following command:

```
request firmware add http://192.168.0.1/build.swu
```

The received firmware image will be in the Inactive position. It is possible to check the download progress of firmware and the newly received firmware using the following command:

```
show firmware
```

To activate the firmware that is in the Inactive position, use the command below. The equipment will reboot automatically after the firmware activation is completed.

```
request firmware activate
Warning: Firmware downgrade may not be totally supported. Please, refer to
the Hardware and Software Compatibility section in the DmOS Release Notes.
Warning: The system will reboot automatically in order to complete the
activation process. Once initiated this process cannot be interrupted.
Proceed with activation? [no,yes] yes
```

An automatic reboot will occur after the activation process is completed.

After the equipment is rebooted, check if the new firmware is in the **Active** position using the command below.

```
show firmware
```

1.2.2 Firmware downgrade

The firmware downgrade process, should be performed in a controlled manner and some precautions are required to avoid incompatibility issues.

DmOS does not preserve the current configuration during the firmware downgrade process, the last configuration used in the previous version of the installed firmware will be loaded.

If the equipment never had the older firmware installed, it does will not have a configuration backup of that version and will boot with factory configuration.

For details on DmOS version compatibility, the document **DmOS Release Notes** should be consulted.

Below are the steps to take in the DmOS firmware downgrade process.

1- Save current setting to a text file.

```
configure
save <FILE_NAME>
```

2 - Request firmware for equipment.

```
request firmware add <protocol://ipaddress/path/fw_name>
```

3 - Verify Firmware Appears with Inactive Status.

```
show firmware
```

4 - Activate the firmware.

```
request firmware activate
```

1.2.3 ONUs Software Update

For hardware platforms that support the GPON technology, the ONU firmware image can be sent to the equipment using the CLI. Before executing the next steps, it is important to ensure that all the ONUs to be updated are in the UP operational status.

Firmware Download

To download the ONU firmware to the OLT execute the following procedure:

```
request firmware onu add tftp://192.168.0.1/fw_onu.bin
```

Wait for the message “ONU firmware file download has succeeded” to proceed with the next steps.

ONU Updating

To update only the ONU 1 in the GPON 1/1/1 interface, the user should proceed with the following command:

```
request firmware onu install fw_onu.bin interface gpon 1/1/1 onu 1
```

To check the update progress, use the following command:

```
show interface gpon 1/1/1 onu
```

ID	Serial Number	Oper State	Software Download State	Name
0	DACM00001533	Down	None	CLIENT-01
1	DACM000001E0	Up	Download in progress (60%)	CLIENT-02
126	DACM00001C7B	Up	None	CLIENT-03
127	DTCM10000006	Up	None	CLIENT-04

During the download status, the ONU status will be in **Download in progress**. After a few minutes the ONU will reset automatically with the new firmware, changing the status to Complete.

Alternatively, it is possible to update an ONU firmware via an L3 interface using the following command:

```
request firmware onu install fw_onu.bin in-band-upgrade ip-address 172.24.1.158 model dm984-42x
username support password support
```

Note that the ONU is referred by its IP address configured in the IP host interface, in this case, it is necessary to configure an IP address to the correspondent VLAN in the OLT via L3 interface, as described in [IP Addresses Configuration](#). This connectivity can be validated using ping to the ONU IP host address from the OLT. During copy firmware process the CLI is unavailable to the user until the procedure finishes.

Updating all ONUs of a PON link

To update all the ONUs of a PON link the user should execute the following procedure. The example shows the update of all the ONUs of the 1/1/7 PON link.

```
request firmware onu install fw_onu.bin interface gpon 1/1/7 all
```

Update will be executed in groups of 8 ONUs.

To check the update progress of all the ONUs, use the following command:

```
show interface gpon 1/1/7 onu
```

ID	Serial Number	Oper State	Software Download State	Name
0	DACM00000B4F	Up	Download in progress (97%)	CLIENT-22
1	DACM00000B7C	Up	Download in progress (97%)	CLIENT-23
2	DACM00000B7B	Up	Download in progress (97%)	CLIENT-24
3	DACM00000B92	Up	Download in progress (97%)	CLIENT-25
4	DACM00000B73	Up	Download in progress (97%)	CLIENT-26
5	DACM00000B8A	Up	Download in progress (97%)	CLIENT-31
6	DACM00000B8E	Up	Download in progress (97%)	CLIENT-32
7	DACM00000B78	Up	Download in progress (92%)	CLIENT-33
8	DACM00000B8D	Up	None	CLIENT-34
9	DACM00000B7A	Up	None	CLIENT-35
10	DACM00000B8B	Up	None	CLIENT-36
11	DACM00000B90	Up	None	CLIENT-37
12	DACM00000B96	Up	None	CLIENT-38
13	DACM00000B74	Up	None	CLIENT-39
14	DACM00000B49	Up	None	CLIENT-40
15	DACM00000B58	Up	None	CLIENT-41
16	DACM00000B15	Up	None	CLIENT-42

During the download, the ONUs status will be in **Download in progress**. After a few minutes the ONUs will reset automatically with the new firmware, changing the status to Complete.

1.3 CLI Overview

The equipment can be managed through the CLI using the equipment console port or using TELNET and SSH sessions.

DmOS' CLI supports the **config** and **operational** modes that provide commands related to config, monitoring of software, hardware and network connectivity with other equipment.

1.3.1 Operational Mode

Upon logging in the equipment, the user will enter automatically in the operational mode. In this mode, it is possible to check the equipment information, execute network connectivity test and other items. However, in this mode, it is not possible to execute modifications in the equipment config.

To visualize the list of commands available in this mode, enter the command ?

It is possible to check some information related to the equipment in the operational mode through the following commands:

Command	Description
show platform	Presents the equipment model, modules and firmware in use
show inventory	Presents the equipment inventory, modules and interfaces in use
show environment	Presents the temperature sensor values
show firmware	Presents the firmware version
show running-config	Presents the equipment current config
show system cpu	Presents the equipment values of the CPU in use
show system memory	Presents the values of equipment memory
show system uptime	Presents the equipment time of activity
who	Present the users connected in the equipment

It is possible to execute any command of the operational mode within the config mode adding the keyword **do** before the command. Below is an example:

```
do show running-config
```

1.3.2 Configuration Mode

To modify the config, entering in the config mode through the following command is required:

```
config
```

If the user would like to exit the config mode, it may use the command below at any config hierarchical level or also enter only **[Ctrl]+[Z]**.

```
end
```

If the user would like to return to the first level of config, it is possible to use the command below at any config hierarchical level.

```
top
```

Two options of config mode are available: **terminal** and **exclusive**. If the command config is not completed, with the preferred mode, by default, the terminal mode will be used.

Terminal Mode

In this mode, any config in the equipment changed by other session will conflict with the config of the current session. In the attempt to save a config, a message with the instructions to solve the conflict will be exhibited. The command below is used to enter in this config mode:

```
config terminal
```

By default, if the user enters in the config mode without specifying any specific mode, the mode to be used will be the terminal mode.

```
config
```

Exclusive Mode

When the user enters in the **exclusive** mode, any other simultaneous session will be unable to apply its configs. The command below is used to enter in this config mode:

```
config exclusive
```

1.3.3 Configuration Types

The DmOS uses the **NETCONF** protocol defined by the **RFC4741**. The NETCONF defines the existence of one or more saved data configs allowing operation of the config in each one. The DmOS uses two configs, however, only one is executing in fact in the equipment, as follows:

- **Candidate-config:** While the user changes the config and does not execute the commit, the config is saved temporarily in a candidate-config. If the device resets or exits the session, the candidate-config will be lost.
- **Running-config:** After the user executes the commit command the candidate-config is applied to the running-config becoming active in the equipment and in all the software components.

When the user enters in the config mode and starts executing configs, the config in fact is still not being applied in the equipment. In this case, the user is writing the config in the candidate-config. The command below shall exhibit the candidate-config of the hierarchical level in which the user is located:

```
show
```

The next command shall exhibit only the changes introduced in the candidate-config:

```
show configuration
```

To activate and save the candidate-config it is important to copy it to the **running-config**. The command below shall save the candidate-config in the **running-config**.

```
commit
```

However, if the user would like only to check the candidate-config but does not wish to copy it to the **running-config** the following command should be used:

```
commit check
```

The user can also confirm temporarily a candidate-config and wait for a confirmation within a given period of time (standard 10 minutes). If the time expires and the user does not confirm, the config will be reversed to the previous. This option is available only in the **exclusive** config mode.

```
commit confirmed
```

The user may abort the config still to be confirmed and before the time limit using the following command:

```
commit abort
```

To delete all the config changes introduced after the last saved config, the user should use the following command:

```
clear
```

1.3.4 Create Alias Command

The DmOS allows the user to create a custom command, making it possible to return the result of one or more commands as a result of only one command.

Suppose the user often runs a script to check system information.

The steps below show how to set up an alias to return the output of the **show environment**, **show platform**, and **show firmware** commands by running only the **show-system** command.

```
config
alias show-system
expansion "show environment ; show platform ; show firmware"
commit
```

The alias command does not allow auto-complete.

1.4 Configuration Management

1.4.1 Stored Configurations

When the user saves a config, a file containing the config changes is generated and stored. To check this list of files, the user should use the following command:

```
show configuration commit list
```

The last 64 committed settings are saved.

1.4.2 Restoring Configuration

If the user would like to reverse the last saved config, it should use the following procedure:

```
rollback configuration
commit
```

The user may restore the more recently saved configs. To do this, it should use the following procedure:

```
rollback configuration FILE-NAME
commit
```

However, if the user would like to select only one specific file that is saved without returning to the most recent changes, it should use the following procedure:

```
rollback selective FILE-NAME  
commit
```

1.4.3 Restoring Factory Config

The procedure below shall delete the entire config and load the default config in its position. Route and IP address configs will be lost.

To load a default config in the candidate-config, the user should execute the command:

```
load factory-config
```

It is possible to execute any config prior to execution of the **commit**. Thus, it is possible to maintain the management config if required.

```
commit
```

1.5 Files Management

1.5.1 Saving the Configuration in File

The user may save the candidate-config in a file (including the standard configs) without applying it in the document. The command below shall save the candidate-config in a file called **CANDIDATE-CONFIG**:

```
save CANDIDATE-CONFIG
```

The user may also save configs made in a specific path using the path filter. For example, if the user would like to save only the config of a MGMT interface (including the standard configs) in a file called **INTF-MGMT-CONFIG**, it should use the following command:

```
save INTF-MGMT-CONFIG interface mgmt
```

Care should be taken not to load a saved file that has no full config using the override option.

1.5.2 Exporting the Files

After saving a file, the user may export such file to a TFTP or SCP server. The command below shall forward the file via TFTP protocol saved as **CANDIDATE-CONFIG** to the 172.1.1.1 server.

```
copy file CANDIDATE-CONFIG tftp://172.1.1.1
```

1.5.3 Importing the Files

After exporting a file, the user may import such file from a TFTP or SCP server. The command below shall download the **CANDIDATE-CONFIG** file from 172.1.1.1 server via TFTP protocol.

```
copy file tftp://172.1.1.1 CANDIDATE-CONFIG
```

1.5.4 File Handling

To exhibit all the saved files, the user should use the following command. As it is an operational mode command, the keyword “**do**” should be added in front of the command when in the config mode.

```
file list
```

It is possible to check the content of a saved file using the following command:

```
file show FILE-NAME
```

To delete a file, the following command should be used: :

```
file delete FILE-NAME
```

1.5.5 Updating config with a saved file

It is possible to merge the candidate-config with a saved file using the **merge** option. Thus, if new commands exist in the file, they will be loaded for the candidate-config. If the commands in the file are in conflict with those in the candidate-config, these will replace the commands in the candidate-config.

```
load merge FILE-NAME  
commit
```

Through the **override** command, the user may delete the entire candidate-config and load a new full config of a file:

```
load override FILE-NAME  
commit
```

1.5.6 File edit

Is possible to edit an existing file or create a new one, if it does not already exist. The file name is limited to 255 characters and must not start with "." or "-", nor contain directory path.

To edit a file, the following command should be used:

```
file edit FILE-NAME
```

The file editor will be opened. Use "CTRL + s" to save the file and "CTRL + x" to exit the editor and return to DmOS CLI.

2 Equipment Management

The network administrator may set an equipment with DmOS in two manners:

- **CLI (Comand-Line Interface):** Provides a set of commands to manage the equipment through a Telnet, SSH connection or through the console port.
- **DmView:** It is the NMS (Network Management System) of DATACOM based on SNMP and NETCONF. The DmView is a network management integrated system and elements, designed to supervise and set DATACOM equipment, offering monitoring, config, provisioning, audit, performance, security, discovery, maps and inventory functionalities.

This chapter will guide the user in how to proceed with the equipment management config through CLI. It contains the following sections:

- Password Configuration
- Licenses Configuration
- Product Model Configuration
- Management Configuration
- CLI Access Configuration
- Hostname Configuration
- Banner Configuration
- System Clock and Date Configuration

2.1 Password Configuration

It is recommended to set the protocol passwords always between double quotations marks "password". Thus, it is possible to set passwords with no problems related to use of special characters.

2.2 Licenses Configuration

A license is required for some equipment operations. To check which licenses your equipment support, use the **show license** command. To get the license contact the DATACOM Support team informing the serial number and the MAC address of the equipment. These informations can be obtained in the **show inventory** command as below:

```
show inventory
...
Chassis/Slot      : 1/1
Product model     : 24GX+4XS+20X
Part number       : 800.5184.01
Serial number     : 4461034
Product revision  : 1
PCB revision      : 1
Hardware version  : 0
Manufacture date  : 01/08/2018
Manufacture hour  : 12:00:00
Operat. temp.    : 0 - 55 Celsius degrees
Base MAC address  : 00:04:df:5c:0c:77
...
```

2.2.1 Enabling MPLS license

The next steps will demonstrate how to activate the MPLS license.

```
config
license mpls enabled key
(<string>): *****
commit
```

The available commands for troubleshooting can be found in the topic [Verifying License](#).

2.2.2 Enabling 100 Gigabit ports license

The next steps will demonstrate how to activate the 100 Gigabit Ports license for all available ports or for a specific number of ports.

```
config
license speed-100g-ports enabled key
(<string>): *****
commit
```

The available commands for troubleshooting can be found in the topic [Verifying License](#).

2.2.3 Verifying Licensing

Below are the main commands available to check the feature. If the user is at the config level, the usage of the keyword **do** before the command is required.

For more details about commands output, check the **Command Reference**.

```
show license
Feature      Status      Number of Licenses
-----
mpls         enabled     N/A
speed-100g-ports enabled     6
```

2.3 Product Model Configuration

DmOS supports Product Model Configuration to change port configuration if supported by equipment. To check if equipment supports this feature use the **card-model** command.

Changing the Product Model will reboot the equipment and return to factory configuration.

This feature is only supported in DM4270 24XS.

2.3.1 DM4270 24XS Product Model Configuration

Product Model	Supported Configuration
24XS+2CX	24 ten-gigabit-ethernet + 2 hundred-gigabit-ethernet
24XS+2QX+1CX	24 ten-gigabit-ethernet + 2 forty-gigabit-ethernet + 1 hundred-gigabit-ethernet
24XS+4QX	24 ten-gigabit-ethernet + 4 forty-gigabit-ethernet

DmOS has the below port mapping:

- **24XS+2CX:** DmOS use the hundred-gigabit-ethernet 1/1/1 and hundred-gigabit-ethernet 1/1/2 for 100 Gigabit ports.
- **24XS+2QX+1CX:** DmOS use the hundred-gigabit-ethernet 1/1/1 for 100 Gigabit port, hundred-gigabit-ethernet 1/1/2 and forty-gigabit-ethernet 1/1/2 for 40 Gigabit ports.
- **24XS+4QX:** DmOS use the hundred-gigabit-ethernet 1/1/1, hundred-gigabit-ethernet 1/1/2, forty-gigabit-ethernet 1/1/1 and forty-gigabit-ethernet 1/1/2 for 40 Gigabit ports.

Example:

```
DmOS# card-model 24XS+2QX+1CX
Warning: The system will automatically reboot and load the factory configuration. Once initiated,
this process cannot be interrupted.
Proceed with this action? [yes,N0]
```

2.4 Management Configuration

It is possible to set the out-of-band management to maintain the access to the equipment even when the data network is deactivated. If the user is connected by the **MGMT interface**, the session will be disconnected after confirmation. To

continue the config of the equipment using the **MGMT interface**, the user should set an IP address in its PC within the same network or connect using the console.

It is possible to set the equipment management using IPv4 or IPv6 address.

It is possible to set the equipment management with a **VRF mgmt**. In this application, only basic services such as SSH, Telnet, Local authentication and firmware updates are supported. See how to set the VRF to proceed with this config.

2.4.1 Configuring Out-of-Band Management

The topology below indicates an example of how to manage the equipment using the **MGMT interface**.

Example of Out-of-Band Management

Considering that the user would like to use the Interface MGMT Interface with the **172.24.22.1/24** IPv4 address and with the **172.24.22.254/24** as standard gateway. The procedure below shall indicate how to execute this config as from the config mode:

```
config
interface mgmt 1/1/1
ipv4 address 172.24.22.1/24
!
!
router static
address-family ipv4
0.0.0.0/0 next-hop 172.24.22.254
commit
```

2.4.2 Configuring In-Band Management

It is possible to set the In-band management to manage the equipment through an interface also used by the data traffic in the network.

It is possible to set the equipment management using IPv4 or IPv6 address.

It is possible to set the equipment management using secondary IPv4 address. Secondary IPv6 address is not supported.

The diagram below shows an example of how to manage the equipment using an In-Band interface.

Example of In-Band Management

Considering that the user would like to use a **VLAN 10** for In-Band management through the **gigabit-ethernet 1/1/1** interface with **172.24.22.1/24** IPv4 address and **172.24.22.254** as standard gateway. The procedure below shall indicate how to carry out this config:

```
config
dotq1 vlan 10
name In_Band-Management
interface gigabit-ethernet-1/1/1
!
interface l3 in-band
ipv4 address 172.24.22.1/24
lower-layer-if vlan 10
!
router static
address-family ipv4
0.0.0.0/0 next-hop 172.24.22.254
commit
```

2.5 CLI Access Configuration

The SSH (Secure Shell) and Telnet are protocols used to provide access to the equipment terminal. For security purposes, the DmOS default configuration is the enabled SSH server protocol and the Telnet server deactivated.

The DmOS supports the SSHv2 with encryption of RSA (Rivest, Shamir and Adelman) public key and DAS (Digital System Algorithm).

2.5.1 Generating SSH Keys

The next steps will indicate how to generate the RSA key.

```
ssh-server generate-key rsa size <1024-2048>
Really want to do this? [yes,no] yes
Generated keys
```

2.5.2 Enabling SSH Legacy Support

For security purposes, the SSH clients executing the OpenSSH with versions above version 7.0 are supported. To obtain the compatibility with previous versions, the user should execute the following procedure.

```
config
ssh-server legacy-support
```

2.5.3 Configuring Maximum Connections of SSH and Telnet

By default, 8 SSH connections and 8 Telnet connections with maximum of 16 connections for each protocol are supported. To change the maximum number of connections to value 10, the user should execute the following procedure.

```
config
ssh-server max-connections 10
telnet-server max-connections 10
commit
```

2.5.4 Enabling Telnet Service

For security, Telnet server is deactivated. If the user would like to activate the Telnet service, it should execute the following procedure:

```
config
telnet-server enabled
commit
```

2.6 Hostname Configuration

2.6.1 Configuring Hostname

Considering that the user would like to use the **DATACOM-ROUTER-R1** name to identify the equipment. The procedure below shall indicate how to carry out this config:

```
config
hostname DATACOM-ROUTER-R1
commit
```

2.7 Banner Configuration

The login banner is displayed after the login.

2.7.1 Configuring Banner in Single Line

It can be configured in a one line command, as shown below.

```
config
banner login "\nRestricted Access\n"
commit
```

The "\" is a scape character. To display a "\", it should be entered "\\"

The available commands for troubleshooting can be found in the topic [Verifying Banner](#).

2.7.2 Configuring Banner in Multiple Line

It is also possible to configure it in multiple lines.

```
config
banner login
(<Hit <cr> to enter in multi-line mode. Alternatively, enter a text between
double quotes. Remember to insert a line break at the end. See command
reference for examples. Maximum length of 3240 characters.>)
(\nRestricted Access\n):
[Multiline mode, exit with ctrl-D.]
>
> Restricted Access
>
> <CTRL-D>
commit
```

The available commands for troubleshooting can be found in the topic [Verifying Banner](#).

2.7.3 Verifying Banner

Below are the main commands available to check the feature. If the user is at the config level, the usage of the keyword **do** before the command is required.

For more details about commands output, check the **Command Reference**.

```
show banner login
```

2.8 System Clock and Date Configuration

2.8.1 Configuring System Clock

The config below adjusts the system's clock in a forced manner, this means, without any synchronization. The clock and date config is important to visualize logs and events in equipment.

It is recommended to use a centralized synchronization through the SNTP protocol.

Considering that the user would like to set the date to **January 20, 2017** and the time to **10 o'clock, 5 minutes and 30 seconds**. The procedure below shall indicate how to carry out this config:

```
set system clock 20170120 10:05:30
```

2.8.2 Configuring Timezone

Considering that the user would like to set the **timezone** to -3.

```
config
clock timezone BRA -3
commit
```

The available commands for troubleshooting can be found in the topic [Verifying Clock](#).

2.8.3 Verifying Clock

Below are the main commands available to check the feature. If the user is at the config level, the usage of the keyword **do** before the command is required.

For more details about commands output, check the **Command Reference**.

```
show system clock
```

3 Network Management

DmOS offers some tools and protocols for network management.

This chapter contains the following sections:

- [LLDP Configuration](#)
- [SNTP Configuration](#)
- [Syslog Configuration](#)
- [SNMP Configuration](#)
- [Ping](#)
- [Traceroute](#)
- [SSH Client](#)
- [Telnet Client](#)

3.1 LLDP Configuration

The Link Layer Discovery Protocol (LLDP) is used to announce interface and management information to directly connected neighbors.

3.1.1 Configuring LLDP between two Neighbors

The configuration below shows how to enable LLDP in interface gigabit-ethernet 1/1/1.

```
lldp
interface gigabit-ethernet-1/1/1
  admin-status tx-and-rx
  notification
!
commit
```

The available commands for troubleshooting can be found in the topic [Verifying LLDP](#).

3.1.2 Verifying LLDP

Below are the main commands available to check the feature. If the user is at the config level, the usage of the keyword **do** before the command is required.

For more details about commands output, check the **Command Reference**.

```
show lldp brief
show lldp statistics
show lldp local
debug enable proto-lldp
```

3.2 SNTP Configuration

The SNTP (Simple Network Time Protocol) is a simplified version of the NTP (Network Time Protocol) which is used to synchronize the system's clock with a server. This config is important to visualize logs and events in the equipment.

3.2.1 Configuring SNTP

The scenario below will be used to illustrate the config of the SNTP.

Example of SNTP config

Considering that the user would like to set the equipment as SNTP customer and use the SNTP server that has the **172.24.22.201** IPv4 address. The procedure below shall indicate how to carry out this config:

```
config
 sntp client
 sntp server 172.24.22.201
commit
```

The available commands for troubleshooting can be found in the topic [Verifying SNTP](#).

3.2.2 Configuring SNTP with Authentication

It is also possible to set the MD5 authentication with the SNTP server. The procedure below shall indicate how to proceed with this config:

```
config
 sntp authenticate
 sntp client
 sntp authentication-key 1 md5 "SERVER-KEY"
 sntp server 172.24.22.201 key 1
commit
```

The available commands for troubleshooting can be found in the topic [Verifying SNTP](#).

3.2.3 Verifying SNTP

Below are the main commands available to check the feature. If the user is at the config level, the usage of the keyword **do** before the command is required.

For more details about commands output, check the **Command Reference**.

```
show sntp
```

3.3 Syslog Configuration

According to RFC5424, the Syslog protocol is used to transport event notification messages. The syslog is used by network devices to send event messages to an external server usually called Syslog Server. For example, if an Ethernet interface is deactivated, a message will be sent to the external server set to alert this change. This config is important to visualize the logs and events of the equipment in the network in a centralized manner.

3.3.1 Configuring Remote Syslog

The scenario below will be used to illustrate config of the Remote Syslog server.

Example of Remote Syslog config

Considering that the user would like to use a **remote syslog server** that has the IPv4 **10.1.100.7** address. The procedure below shall indicate how to carry out this config:

```
config
log syslog 10.1.100.7
commit
```

The available commands for troubleshooting can be found in the topic [Verifying Syslog](#).

3.3.2 Verifying Syslog

Below are the main commands available to check the feature. If the user is at the config level, the usage of the keyword **do** before the command is required.

For more details about commands output, check the **Command Reference**.

```
show log
```

3.4 SNMP Configuration

SNMP is a protocol that helps the network administrators to manage the network devices and troubleshoot network problems. The network management system is based on two main elements: a manager and agents. The SNMP protocol has three versions:

Version	Description
SNMPv1	Original version of the SNMP, strings of communities sent in simple text with weak security.
SNMPv2c	Version developed to correct some problems of v1. However, several versions were developed, not truly approaching the problems with v1. The v2c version is the mostly used version and improved handling of protocols as compared to version v1, resulting in operations slightly enhanced. However, security is still a problem because it uses strings of community in simple text.
SNMPv3	Most recent version of the SNMP, supporting security and SHA authentication and full MD5. Should be used, if possible, specifically in non reliable networks.

3.4.1 Configuring SNMPv2

The scenario below will be used to illustrate config of the SNMPv2.

Example of SNMP config

The configuration below shows how to enable a SNMPv2 client with **public** community.

```
config
snmp agent enabled
snmp agent version v2c
snmp community public
sec-name public
!
```

It is possible to specify in which interface SNMP should receive requests through the **listen interface** configuration. By doing that, it is possible to use SNMP in VRFs.

```
config
snmp agent listen interface l3-myintf
```

For the equipment to send traps to server **172.22.1.152**, the configuration below can be used.

```
config
snmp target SNMP-Trap-Server
ip 172.22.1.252
v2c sec-name public
tag [ std_v2_trap ]
!
snmp notify std_v2_trap
tag SNMP-Trap-Server type trap
!
commit
```

The SNMP target can also be assigned to a VRF.

```
config
snmp target SNMP-Trap-Server
vrf myvrf
ip 172.22.1.252
v2c sec-name public
tag [ SNMP-Trap-Server ]
!
```

There are no troubleshooting commands for this functionality.

3.4.2 Configuring SNMPv3

To connect the equipment to the SNMPv3 server that is in the VACM-SNMPv3 group with dmview user and that has password authentication in **MD5** equal to **dmview123-md5** and privacy password in **AES** equal to **dmview123-aes**,

proceed in the following manner:

```
config
snmp agent enabled
snmp agent version v3
snmp vacm group VACM-SNMPv3
  member dmview
  sec-model [ usm ]
!
access usm auth-priv
  read-view root
  write-view root
  notify-view root
!
!
snmp vacm view root
  subtree 1.3
  included
!
!
snmp usm local user dmview
  auth md5 password "dmview123-md5"
  priv aes password "dmview123-aes"
!
snmp usm remote 12:34:00:00:00:00:00:00:00:00:00:00
  user dmview
!
commit
```

It is possible to specify in which interface SNMP should receive requests through the **listen interface** configuration. By doing that, it is possible to use SNMP in VRFs.

```
config
snmp agent listen interface l3-myintf
```

For the equipment to send traps to server **172.22.1.152**, the configuration below can be used.

```
config
snmp target SNMP-Trap-Server
  ip 172.22.1.252
  tag [ std v3 inform std v3 trap ]
  engine-id 12:34:00:00:00:00:00:00:00:00:00:00
  usm user-name dmview
  usm sec-level no-auth-priv
!
commit
```

The SNMP target can also be assigned to a VRF.

```
config
snmp target SNMP-Trap-Server
  vrf myvrf
  ip 172.22.1.252
  tag [ std v3 inform std v3 trap ]
  engine-id 12:34:00:00:00:00:00:00:00:00:00:00
  usm user-name dmview
  usm sec-level no-auth-priv
!
```

There are no troubleshooting commands for this functionality.

3.5 Ping

The ping command is a common method to check the connectivity of the equipment with the other equipment or to test a specific protocol.

The user should use the keyword **do** before the command if it is in the config mode.

To execute a ping with **IPv4 address**, follow the procedure below:

```
ping 5.178.41.1
PING 5.178.41.1 (5.178.41.1) 56(84) bytes of data.
64 bytes from 5.178.41.1: icmp_seq=1 ttl=61 time=2.15 ms
64 bytes from 5.178.41.1: icmp_seq=2 ttl=61 time=2.06 ms
64 bytes from 5.178.41.1: icmp_seq=3 ttl=61 time=2.12 ms
64 bytes from 5.178.41.1: icmp_seq=4 ttl=61 time=2.27 ms
64 bytes from 5.178.41.1: icmp_seq=5 ttl=61 time=2.07 ms
--- 5.178.41.1 ping statistics ---
5 packets transmitted, 5 received, 0% packet loss, time 4005ms
rtt min/avg/max/mdev = 2.065/2.139/2.272/0.074 ms
```

To execute a ping with **IPv6 address**, follow the procedure below:

```
ping6 2002:c0a8:fe05::6
PING 2002:c0a8:fe05::6(2002:c0a8:fe05::6) 56 data bytes
64 bytes from 2002:c0a8:fe05::6: icmp_seq=1 ttl=62 time=7.94 ms
64 bytes from 2002:c0a8:fe05::6: icmp_seq=2 ttl=62 time=4.66 ms
64 bytes from 2002:c0a8:fe05::6: icmp_seq=3 ttl=62 time=5.05 ms
64 bytes from 2002:c0a8:fe05::6: icmp_seq=4 ttl=62 time=5.00 ms
64 bytes from 2002:c0a8:fe05::6: icmp_seq=5 ttl=62 time=6.84 ms
--- 2002:c0a8:fe05::6 ping statistics ---
5 packets transmitted, 5 received, 0% packet loss, time 4005ms
rtt min/avg/max/mdev = 4.664/5.903/7.948/1.274 ms
```

Using the **source** parameter, it is possible to specify the source IP address of the ICMP packets. It is also possible to specify a source interface. To ping addresses in a VRF (IPv4 only), a interface assigned to the VRF should be specified as source.

3.6 Traceroute

The traceroute command is a method to execute the network diagnosis informing the hop-by-hop connectivity through which the pack is passing until the final destination.

The user should use the keyword **do** before the command if it is in the config mode.

To execute a traceroute with **IPv4 address**, follow the procedure below:

```
traceroute 5.178.41.1
traceroute to 5.178.41.1 (5.178.41.1), 30 hops max, 38 byte packets
 1  192.168.48.3 (192.168.48.3)  2.029 ms  4.345 ms  1.751 ms
 2  192.168.48.1 (192.168.48.1)  2.842 ms  2.488 ms  3.226 ms
 3  192.168.254.22 (192.168.254.22)  3.582 ms  3.403 ms  3.622 ms
 4  192.168.84.22 (192.168.84.22)  2.306 ms  1.802 ms  2.264 ms
 5  5.178.41.1 (5.178.41.1)  2.219 ms  1.651 ms  54.376 ms
```

To execute a traceroute with **IPv6 address**, follow the procedure below:

```
traceroute6 2002:c0a8:fe05::6
traceroute to 2002:c0a8:fe05::6 (2002:c0a8:fe05::6) from 1997::c0a8:3002,
30 hops max, 16 byte packets
 1  1997::c0a8:3001 (1997::c0a8:3001)  13.877 ms  2.298 ms  2.249 ms
 2  2001::c0a8:3001 (2001::c0a8:3001)  3.64 ms  2.969 ms  2.869 ms
 3  2002:c0a8:fe05::6 (2002:c0a8:fe05::6)  4.444 ms  3.624 ms  5.787 ms
```

3.7 SSH Client

It is possible to access other equipment using SSH protocol as from an equipment with DmOS.

The user should use the keyword **do** before the command if it is in the config mode.

To access an equipment with IPv4 **192.168.1.254** address through the **SSH**, the user should use the command below, specifying the user to be authenticated, in this example, the **admin** user:

```
ssh admin@192.168.1.254
```

3.8 Telnet Client

It is possible to access other equipment using Telnet protocol as from an equipment with DmOS.

The user should use the keyword **do** before the command if it is in the config mode.

To access an equipment with IPv4 **192.168.1.254** address through the **TELNET** the user should use the command mentioned below:

```
telnet 192.168.1.254
```

4 OAM

This chapter shows a group of Operations, Administration and Maintenance (OAM) functionalities that provide indication of network failure, fault location, performance information, data functions and diagnostic. It contains the following sections:

- CFM Configuration
- EFM Configuration
- Traffic Loop Configuration
- TWAMP Configuration
- sFlow Configuration
- Task scheduling configuration
- User Defined Counters Configuration

4.1 CFM Configuration

The CFM (Connectivity Fault Management) protocol is defined in the **IEEE 802.1ag** standard and provides an assurance of end-to-end full path, point-to-point or in a LAN made up by several equipment. In the CFM, network entities formed by network operators, service providers and end clients are part of different network domains managed by different individuals. In the CFM, the domains are the MD (Maintenance Domain) that have levels that in turn have one or more MAs (Maintenance Association) that are responsible for protection of a list of VLANs where the MEP will communicate. The MEPs (Maintenance End Point) are active entities responsible for sending of CFM PDUs.

DmOS does not support MIPs.

4.1.1 Configuring CFM

The scenario below will be used to illustrate the config of CFM between Customer and Service Provider.

Implementation of the CFM

Considering that the user would like to execute the following configs:

- **Equipment A:** VLAN 2000 for the CFM with a gigabit-ethernet-1/1/1 interface as MEP 1 – Down in level 6.
- **Equipment B:** VLAN 2000 for CFM with gigabit-ethernet-1/1/2 interface as MEP 1 – Up in level 4 and the ten-gigabit-

ethernet-1/1/1 interface as Uplink of VLAN 2000.

- **Equipment C:** VLAN 2000 for CFM with gigabit-ethernet-1/1/2 interface as MEP 2 – Up in level 4 and the ten-gigabit-ethernet-1/1/1 interface as Uplink of VLAN 2000.
- **Equipment D:** VLAN 2000 for the CFM with a gigabit-ethernet-1/1/1 interface as MEP 2 – Down in level 6.
- All MEPs enable fault alarm notification for all errors.

4.1.2 Configuring CFM with QinQ

The scenario below will be used to illustrate the config of CFM between Customer and Service Provider with QinQ to support some clients in Service VLAN.

Implementation of the CFM

Considering that the user would like to execute the following configs:

- **Equipment A:** VLAN 2000 for the CFM with a gigabit-ethernet-1/1/1 interface as MEP 1 – Down in level 6.
- **Equipment B:** QinQ in VLAN 3000 for CFM with gigabit-ethernet-1/1/2 interface as MEP 1 – Up in level 4 and the ten-gigabit-ethernet-1/1/1 interface as Uplink of VLAN 3000.
- **Equipment C:** QinQ in VLAN 3000 for CFM with gigabit-ethernet-1/1/2 interface as MEP 2 – Up in level 4 and the ten-gigabit-ethernet-1/1/1 interface as Uplink of VLAN 3000.
- **Equipment D:** VLAN 2000 for the CFM with a gigabit-ethernet-1/1/1 interface as MEP 2 – Down in level 6.
- All MEPs enable fault alarm notification for all errors.

The available commands for troubleshooting can be found in the topic [Verifying CFM](#).

4.1.3 Enabling Alarm Indication Signal (ETH-AIS)

The Ethernet Alarm Indication Signal ETH-AIS has been proposed by ITU-Y.1731 to avoid flagging the same fault repeatedly in a scenario with more than one domain when the internal domain fails.

For AIS messages to be issued, the configuration must be enabled in the MA. AIS messages will be sent to the domain with a level immediately above yours, that is, an external domain.

When transmission is enabled, AIS frames are transmitted when a fault is detected, regardless of any alarm configuration and report. When AIS alarm suppression is enabled, alarms are not reported if AIS frames are received.

AIS reception takes the alarm-suppression parameter only.

Below is an example configuration for transmitting and receiving AIS for a particular MA.

```

oam
cfm
md Client
level 6
ma Client
primary-vlan-id 2000
vlan-list 2000

```

```

commit

```

The available commands for troubleshooting can be found in the topic [Verifying CFM](#).

4.1.4 Enabling Action Block

CFM supports interface blocking configuration with MEPs that are on failure. When the interfaces are in the blocking state, the layer 2 protocols (RSTP, EAPS, ERPS, LLDP) are signalized and changed to failure status. This feature helps the convergence of protocols. Scenarios in which the equipment are directly connected are supported.

The feature is only supported in MEP Down.

LACP, Link-flap, and loopback-detection are not triggered by CFM.

All MEPs should support action block so that the interface is not blocked in only one of the equipment.

The figure illustrates the point where the topology block occurs if the blocking action is configured the MEP interface.

Scenario with CFM action block

The configuration of equipment A and D with blocking action in MEP is shown below.

```
!Equipment A
config
dot1q
vlan 2000
interface gigabit-ethernet-1/1/1 tagged
!
!
oam

The available commands for troubleshooting can be found in the topic [Verifying CFM](#).

4.1.5 Enabling Action Shutdown

CFM supports the shutdown configuration of the interfaces when the MEPs on failure. When the interfaces are in the shutdown state, the other protocols configured on this interface are signaled by changing to failure status.

The feature is only supported in MEP Up.

The figure illustrates the point where shutdown occurs in the topology if the shutdown action is configured in the MEP interface.

Scenario with CFM action shutdown

The configuration of equipment B and C with shutdown action in MEP is shown below.

```
!Equipment B
config
dot1q

commit
```

The available commands for troubleshooting can be found in the topic [Verifying CFM](#).

4.1.6 Fault management

The available commands for troubleshooting can be found in the topic [Verifying CFM](#).

Continuity Check Protocol

The CFM Continuity Check Protocol is used to fault detection, notification and recovery. Below are the commands to check the communication exchanged between MEPS.

Loopback Protocol

The CFM Loopback Protocol is similar to Ping, but it is in Ethernet layer, being possible to check faults between MEPS.

```
oam cfm loopback md <md_name> ma <ma_name> mep <local_mep_id> remote-mep <remote_mep_id>
```

LinkTrace Protocol

The CFM LinkTrace Protocol is similar to Traceroute, but it is in Ethernet layer, being possible to discover the path and isolate faults.

```
oam cfm linktrace md <md_name> ma <ma_name> mep <local_mep_id> remote-mep <remote_mep_id>
```

4.1.7 Verifying CFM

Below are the main commands available to check the feature. If the user is at the config level, the usage of the keyword **do** before the command is required.

```
show oam cfm
show oam cfm brief
show oam cfm detail
show oam cfm local
show oam cfm remote
show oam cfm statistics
show alarm
debug enable cfm-ais-rx
debug enable cfm-ais-tx
debug enable cfm-discard
debug enable cfm-loopback
debug enable cfm-linktrace
```

4.2 EFM Configuration

EFM (Ethernet in the First Mile) is an OAM (Operations, Administration and Maintenance) protocol defined in the **IEEE 802.3ah** standard for link monitoring, blocking the interface when communication is lost.

4.2.1 Enabling EFM

The scenario below will be used to illustrate the config of EFM link monitoring between equipment A and equipment B.

```
config
oam
 efm
  interface ten-gigabit-ethernet-1/1/1
  !
  !
commit
```

The available commands for Troubleshooting can be found in the topic [Verifying EFM](#).

4.2.2 Verifying EFM

Below are the main commands available to check the feature. If the user is at the config level, the usage of the keyword **do** before the command is required.

```
show oam efm
show oam efm interface <interface>
debug enable proto-efm
```

4.3 Traffic Loop Configuration

4.3.1 Configuring Traffic Loop for L2 Traffic Validation

The DmOS lets you loop L2 flows to meet RFC 2544 tests or other traffic testing to validate circuit delivery to the client. The following is an example of Feature Configuration.

Traffic loop scenario

Suppose the user wants to loop traffic using the VLAN 400 with gigabit-ethernet-1/1/1 interface as uplink interface. The configured MAC addresses must respect the configured data stream on the generator.

To avoid the risk of loss of access to equipment management, it is recommended to use the Traffic Loop functionality in the exclusive management mode.

```
config exclusive
dot1q
vlan 400
interface gigabit-ethernet-1/1/1
!
traffic-loop 1
interface gigabit-ethernet-1/1/1
source-mac-address 00:00:00:00:00:01
destination-mac-address 00:00:00:00:00:02
vlan 400
!
```

The user must use the **commit confirmed** command to save and apply the configuration. In the example below the commit will temporarily apply the configuration for 10 minutes. The user can change the commit time if necessary.

```
commit confirmed 10
```

There are no troubleshooting commands for this functionality.

4.4 TWAMP Configuration

The Two-Way Active Measurement Protocol (TWAMP) measures network performance parameters such as latency, latency variation (jitter), and packet loss. The implementation of the TWAMP server is based on the specifications described in RFC 5357.

The TWAMP server solution architecture defines the following logical components:

- **Session Reflector:** Adds information to the received test packets and sends them back.
- **Server:** Manages multiple TWAMP sessions.

The TWAMP client solution architecture defines the following logical components:

- **Session Sender:** Creates and sends TWAMP test packets to the Session Reflector.
- **Control Client:** Sends requests to the TWAMP server to establish new sessions.

TWAMP Architecture

4.4.1 Configuring TWAMP Reflector

Suppose the user wants to configure a TWAMP Reflector. The following procedure will show you how to perform this configuration:

Authentication/Encryption is not supported

```
config
 oam twamp reflector
commit
```

TWAMP listens to the port 862 by default. That port can be changed, as shown below.

```
config
 oam twamp reflector port 4000
commit
```

The available commands for troubleshooting can be found in the topic [Verifying TWAMP](#).

4.4.2 Configuring ACLs in TWAMP Reflector

It is possible to restrict which clients can communicate with the reflector. The configuration below restricts access to network 10.1.15.0/24, IPv4 address 192.168.80.26 and IPv6 address 2001:c0a8:ff23::1 only.

```
config
 oam
 twamp
  reflector
   ipv4
    client-address 192.168.80.26
  !
```

```

client-network 10.1.15.0/24
|
| ipv6
| client-address 2001:c0a8:ff23::1
|
commit

```

The available commands for troubleshooting can be found in the topic [Verifying TWAMP](#).

4.4.3 Calculating the maximum number of sessions in TWAMP Reflector

TWAMP Reflector supports a maximum number of *simultaneous* test sessions. Test sessions above this limit are rejected and the TWAMP Sender will perform retries until the session is established.

To determine the maximum number of *non simultaneous* sessions supported by the reflector, the following formula can be used: *simultaneous test-sessions x (interval between tests / test duration)*.

As example, for a maximum number of simultaneous sessions of 8, using the value of test duration of 20s and the default value of interval between tests of 300s, the maximum theoretical number of non simultaneous test sessions is $8 \times (300/20) = 120$.

The Product Datasheet should be consulted to obtain the values of maximum simultaneous sessions for each platform.

4.4.4 Configuring TWAMP Sender

The scenario below will be used to demonstrate the TWAMP configuration.

Suppose the user wants to configure two TWAMP Sender sessions, one IPv4 and another IPv6, both communicating with the Reflector through port 4000. The following procedure will show you how to perform this configuration:

```

config
oam
twamp
  sender connection 1
  server-port 4000
  ipv4 source-address 192.168.80.26
  |
  | ipv4 target-address 192.168.80.25
  |
  test-session 1

```

```

    ipv4 source-address 192.168.80.26
    !
    ipv4 target-address 192.168.80.25
    !
    !
sender connection 2
server-port 4000
    !
    ipv6 source-address 2001:c0a8:ff23::1
    !
    ipv6 target-address 2001:c0a8:ff23::2
    !
test-session 2
    !
    ipv6 source-address 2001:c0a8:ff23::1
    !
    ipv6 target-address 2001:c0a8:ff23::2
    !
commit

```

The available commands for troubleshooting can be found in the topic [Verifying TWAMP](#).

4.4.5 Configuring TWAMP in VRF

It is also possible to configure TWAMP (Reflector/Sender) on VRF.

Below the configuration of TWAMP Reflector in VRF TWAMP. For VRF configuration, see topic [VRF Configuration](#).

```
config
oam
twamp
  reflector
  vrf TWAMP
commit
```

DmOS supports only one instance of TWAMP Reflector on device. TWAMP Reflector does not support configuring more than one instance, even on separate VRFs.

Below the configuration of TWAMP Sender in VRF TWAMP. For VRF configuration, see topic [VRF Configuration](#).

```
config
oam
twamp
  sender connection 1
  vrf TWAMP
```

4.4.6 Verifying TWAMP

Below are the main commands available to check the feature. If the user is at the config level, the usage of the keyword **do** before the command is required.

For more details about commands output, check the **Command Reference**.

```
show oam twamp reflector
show oam twamp reflector connection brief
show oam twamp reflector connection detail
show oam twamp reflector test-session brief
show oam twamp reflector test-session detail
show oam twamp sender connection all brief
show oam twamp sender connection all test-session
show oam twamp sender connection all test-session-statistics
debug enable proto-twamp
```

4.5 sFLOW Configuration

The sFlow is a technology for monitoring data that travels on the network. A great advantage of sFlow is forward not all collected traffic to the sFlow collector, instead sFlow only forwards traffic samples to the collector at a configurable rate, reducing the computational load.

For sFlow operation, two components are required:

- **sFlow Agent:** Function assigned to switches, routers, access points that samples transmitted and/or received packets and forward them to a sFlow collector.
- **sFlow Collector:** Function assigned to analyze the information received from each sFlow Agent.

Having as sampling technique:

- **Flow Sampling:** Based on the packet sample, used to obtain information from the package contents such as protocols and etc.
- **Counter sampling:** Based on the time sample, used to obtain statistics of interfaces.

Only Flow Sampling is supported.

Only one sFlow collector is allowed.

In the egress traffic only unicast packages will be sampled.

4.5.1 Configuring sFLOW

Suppose the user wishes to monitor the data streams forwarded through the interface gigabit-ethernet-1/1/10.

Below is an example of how to configure sFlow agent on the 1/1/10 gigabit-ethernet interface by sending samples to

COLLECTOR-1 on port 1555. By default the collector port is 6343.

In the egress traffic only unicast packages will be sampled.

Only one sFlow collector is allowed.

```
config
oam
sflow
collector COLLECTOR-1
  ipv4 172.22.107.14
  port 1555
!
interface gigabit-ethernet-1/1/10
  flow-sampling-collector COLLECTOR-1
!
commit
```

There are no troubleshooting commands for this functionality.

4.6 Task scheduling configuration

It is possible to schedule task execution using the **assistant-task** feature.

The first step is to create a file with the commands to be executed. To create a command file, consult the topic **File Edit** in chapter [Files Management](#).

It is possible to create the file on another equipment and later import to run.

The file must be copied to the device via TFTP or SCP. See topic **Importing the Files** in the chapter [Files Management](#).

DmOS only supports ASCII format files.

4.6.1 Automatic reboot configuration

In the example below, an automatic reboot has been schedule to be executed on **30-Sep-2019 as 02:00AM**.

A file **reboot.cli** has been created with the commands below. Content can be viewed with the command **file show**.

```
file show reboot.cli
reboot
```

Finally, the reboot can be scheduled. This task will be executed only once, so the parameter **once** was inserted.

```
config
assistant-task reboot
action cli-file reboot.cli
schedule once day 30 month 9 hour 2 minute 0
!
```

The available commands for troubleshooting can be found in the topic [Verifying Assistant Task](#).

4.6.2 Automatic backup configuration

Another possible use of assistant-task is configuration backup.

In the example below, there is a script that saves the current configuration to file **config.txt** and sends it to TFTP server **192.168.0.1**.

```
file show config.txt
show running-config | save overwrite config.txt
copy file config.txt tftp://192.168.0.1/
```

The **overwrite** parameter was used to save the file. In case the file already exists, it will be automatically overwritten without confirmation.

The script execution is scheduled for every day at 06:00AM

```
config
assistant-task config-backup
action cli-file config-backup.txt
schedule recursive hour 6
!
```

The available commands for troubleshooting can be found in the topic [Verifying Assistant Task](#).

4.6.3 Executing a task manually

To execute the task manually once, the following command can be used.

```
assistant-task config-backup run-now
```

The available commands for troubleshooting can be found in the topic [Verifying Assistant Task](#).

4.6.4 Running a task from a pattern

The assistant-task allows to perform actions based on the output of a command. To use this feature must be used the **watch** parameter.

Below is an example of a task to be run every minute (no date/time specified), checking link connectivity. When connectivity fails on the primary link, it changes the default route to the secondary link and vice versa.

Do not use "|" repeat" or other commands that have no return, otherwise the assistant task will not be able to log its output and it will run indefinitely, until it is interrupted by the "logout" command.

Scenario Assistant Task with watch.

Checking the contents of the connectGw1.cli file.

```
file show connectGw1.cli
config
router static address-family ipv4 0.0.0.0/0 next-hop 10.1.1.2
no router static address-family ipv4 0.0.0.0/0 next-hop 10.2.2.2
commit
```

Checking the contents of the connectGw2.cli file.

```
file show connectGw2.cli
config
no router static address-family ipv4 0.0.0.0/0 next-hop 10.1.1.2
router static address-family ipv4 0.0.0.0/0 next-hop 10.2.2.2
commit
```

Creating a action to change the default route gateway when connectivity fails on the primary link. Note that the **regex** parameter sets a pattern to match the return of the command set in **watch cli-cmd**.

All **watch match** rules is checked against **watch cli-cmd** and all rules that matchis run.

```
config
assistant-task ChangeGW
schedule recursive hour *
schedule recursive minute 0-59
action watch cli-cmd "ping 10.1.1.2 | include loss"
action watch match M0
cli-file connectGw2.cli
regex "received, \+5 errors, 100\% packet loss"
!
action watch match M1
cli-file connectGw1.cli
regex "received, 0\% packet loss"
commit
```

It is necessary use the escape character "\" before special characters for regex to work properly.

4.6.5 Verifying Assistant Task

Below are the main commands available to check the feature. If the user is at the config level, the usage of the keyword **do** before the command is required.

For more details about commands output, check the **Command Reference**.

```
show assistant-task
show assistant-task <task-name> last-success output
show assistant-task <task-name> last-failure output
```

4.7 User Defined Counters Configuration

User defined counters can be used to measure VLAN or interface traffic.

4.7.1 VLAN counters configuration

In the example below, a counter to configure the VLAN 13 ingress is configured.

```
counters
ingress id 1
description "VLAN 13 ingress counter"
type octets
vlan 13
!
```

For egress traffic, it is configured similarly.

```
counters
egress id 1
description "VLAN 13 egress counter"
type octets
vlan 13
```

```
!
```

When specifying a VLAN, untagged interfaces will not have their traffic accounted.

The available commands for troubleshooting can be found in the topic [Verifying Counters](#).

4.7.2 Interface counters configuration

In the previous example, packets from all interfaces assigned to VLAN 13 are accounted. To limit the counter to a specific interface, it can be specified as following.

```
counters
  egress id 1
  description "VLAN 13 egress counter"
  type octets
  vlan 13
  interface ten-gigabit-ethernet-1/1/1
!
```

Counters can be used to measure traffic of two or more interfaces simultaneously. In the following configuration, a counter measures egress traffic of both interfaces TenGigabitEthernet 1/1/1 and 1/1/2.

```
counters
  egress id 1
  description "Interface egress counter"
  type octets
  interface ten-gigabit-ethernet-1/1/1 ten-gigabit-ethernet-1/1/2
!
```

The counters values can be collected through SNMP. Please ask Datacom Support for the DmOS MIBs.

The available commands for troubleshooting can be found in the topic [Verifying Counters](#).

4.7.3 Verifying Counters

Below are the main commands available to check the feature. If the user is at the config level, the usage of the keyword **do** before the command is required.

For more details about commands output, check the **Command Reference**.

```
show counters
show counters ingress
show counters ingress id <id>
show counters egress
show counters egress id <id>
```

5 Users Authentication

DmOS uses levels of privileges to define which information is available to user account in the equipment. Three levels of management access of users are supported: admin, config and audit.

Level	Description
admin	Allows exhibition and change of all the device parameters. It is a full access of reading and writing for the entire device.
config	Allows some functions more than only reading, however, less than the admin level. Allows the user to visualize all the device parameters. Allows all the config commands, except those for device administration purposes, such as: hostname, SNMP, monitor, RADIUS, SNTP, TACACS+ and Local users.
audit	Allows only reading functions.

Only one user account is set by default in the DmOS. The user is the **admin** with **admin** password and has admin level of privileges.

For security purposes, it is highly recommended to change the equipment standard password.

It is recommended to set the protocol passwords always between double quotations marks "password". Thus, it is possible to set passwords with no problems related to use of special characters.

To change the admin user standard password, follow the steps below:

```
config
aaa user admin password "new-password"
commit
```

This chapter contains the following sections:

- [Local Users Configuration](#)
- [TACACS+ Configuration](#)
- [RADIUS Configuration](#)
- [Authentication Order Configuration](#)

5.1 Local Users Configuration

5.1.1 Creating a new Local User

The next steps shall indicate how to set a new user called “**joao**” with “**joao1234**” password and with “**admin**” administrator privileges.

```
config
aaa user joao password "joao1234"
group admin
commit
```

5.1.2 Deleting a Local User

The next steps will indicate how to delete the user “joao”.

```
config
no aaa user joao
commit
```

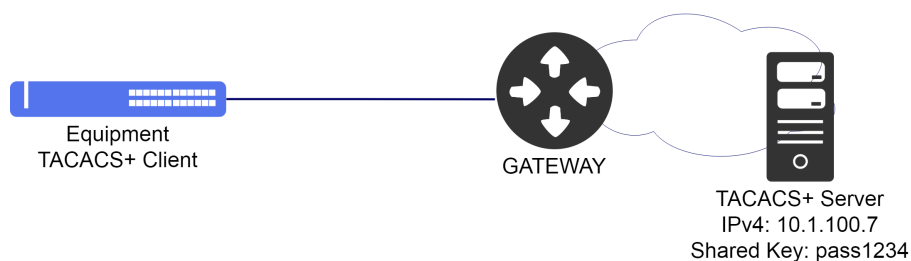

There are no troubleshooting commands for this functionality.

5.2 TACACS+ Configuration

The TACACS+ (Terminal Access Controller Access-Control System) is a protocol based on model AAA that provides the authentication, authorization and accounting services in a safe manner with encryption of the entire packet. This encryption depends on a shared secret key configured in the equipment.

5.2.1 Configuring a TACACS+ Server

The scenario below will be used to illustrate config of the TACACS+.

Example of TACACS+

For the accounting service to work it is mandatory that the user be authenticated also through the TACACS+ server.

The configuration below shows how to configure TACACS+ using a server with IPv4 address **10.1.100.7** and authentication password equal to **“pass1234”**. The procedure indicates how to enable authentication, authorization and accounting:

```
config
aaa server tacacs TACACS-SERVER host 10.1.100.7
shared-secret "pass1234"
authentication
authorization
accounting
commit
```

It is possible to specify a interface in the TACACS+ configuration, which will be used as the source address for the packets generated by the TACACS+ client. The specified interface can be in a VRF.

```
config
aaa server tacacs TACACS-SERVER host 10.1.100.7
shared-secret "pass1234"
authentication
authorization
accounting
source interface l3-myintf
commit
```

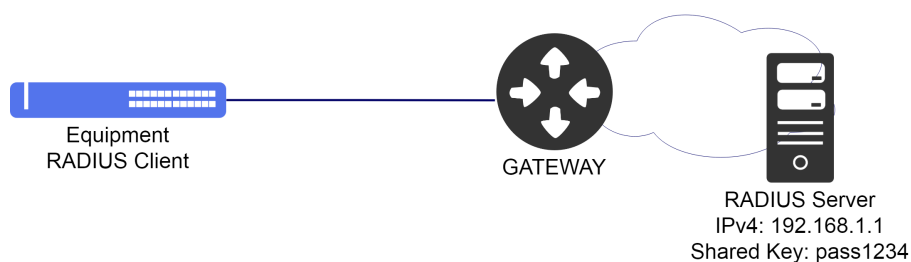

There are no troubleshooting commands for this functionality.

5.3 RADIUS Configuration

The RADIUS (Remote Authentication Dial In User Service) is a protocol based on model AAA that provides the authentication, authorization and accounting services. Communication between the RADIUS customer and the RADIUS server is safe and an exclusive key-word in both systems is required.

5.3.1 Configuring a RADIUS Server

The scenario below will be used to illustrate config of the RADIUS.

Example of RADIUS

Considering that a user would like to set a **RADIUS** server that has the IPv4 **192.168.1.1** address and authentication password equal to **“pass1234”**. The procedure below shall indicate how to execute this config enabling the authentication, authorization and accounting:

```
config
aaa server radius RADIUS-SERVER host 192.168.1.1
  shared-secret "pass1234"
  authentication
  accounting
commit
```

It is possible to specify a interface in the RADIUS configuration, which will be used as the source address for the packets generated by the RADIUS client. The specified interface can be in a VRF.

```
config
aaa server radius RADIUS-SERVER host 192.168.1.1
  shared-secret "pass1234"
  authentication
  accounting
  source interface l3-myintf
commit
```

There are no troubleshooting commands for this functionality.

5.4 Authentication Order Configuration

The user may define the authentication-order between: **local**, **RADIUS** and **TACACS+**. When a user tries to login in the system, the DmOS will try to authenticate it following the order defined by the CLI command “**authentication-order**”.

5.4.1 Configuring RADIUS with higher priority

Considering that a user has configured a RADIUS server to be used as an authentication method and would like to use it as a preferential method, however it would like to use the authentication in the local base in case of communication failure with the RADIUS server. The procedure to execute this config is indicated below:

```
config
aaa authentication order [radius local]
commit
```

5.4.2 Configuring TACACS+ with higher priority

Considering that a user has configured a TACACS+ server to be used as an authentication method and would like to use it as a preferential method. The procedure to execute this config is indicated below:

```
config
aaa authentication order [tacacs local]
commit
```

6 Interfaces

This chapter will provide examples of how to configure Ethernet interfaces. For GPON interfaces, please check GPON chapter.

This chapter contains the following sections:

- [Ethernet Interfaces Configuration](#)
- [Link Aggregation Configuration](#)
- [Port Mirroring Configuration](#)
- [Link Flap Detection Configuration](#)

6.1 Ethernet Interfaces Configuration

6.1.1 Configuring Ethernet Interfaces

To configure an Ethernet interface, the user should enter in the interface config level.

To configure a 1G interface located in Chassis 1, Slot 1 and Port 1 (1/1/1), the user should use the following command:

```
config
interface gigabit-ethernet 1/1/1
```

To configure a 10G interface located in Chassis 1, Slot 1 and Port 1 (1/1/1), the user should use the following command:

```
config
interface ten-gigabit-ethernet 1/1/1
```

To configure a 40G interface located in Chassis 1, Slot 1 and Port 1 (1/1/1), the user should use the following command:

```
config
interface forty-gigabit-ethernet 1/1/1
```

To configure a 100G interface located in Chassis 1, Slot 1 and Port 1 (1/1/1), the user should use the following command:

```
config
interface hundred-gigabit-ethernet 1/1/1
```

Numbering scheme of the port of the chassis/slot/port was designed for standardization with equipment of several slots and chassis. Thus, it is always necessary to enter the full location, even if the equipment has no several slots or chassis.

To administratively disable a 1G interface, the user should use the following procedure. The same procedure is used if the user would like to disable interfaces of other capacities, such as 10G, 40G or 100G.

```
config
interface gigabit-ethernet 1/1/1
shutdown
commit
```

The available commands for troubleshooting can be found in the topic [Verifying Interfaces](#).

To reactivate an 1G interface, the user should use the command “no shutdown”. The same procedure is used if the user would like to reactivate interfaces of other capacities, such as 10G or 40G.

```
config
interface gigabit-ethernet 1/1/1
no shutdown
commit
```

The available commands for troubleshooting can be found in the topic [Verifying Interfaces](#).

6.1.2 Configuring Ethernet Interfaces Range

It is possible to configure several interfaces at the same time using the range of interfaces. The procedure below gives an example of how to deactivate the gigabit-ethernet 1/1/1, 1/1/2, 1/1/3 and 1/1/4 interfaces using the range.

```
config
interface gigabit-ethernet 1/1/1-4
shutdown
commit
```

The available commands for troubleshooting can be found in the topic [Verifying Interfaces](#).

6.1.3 Configuring Ethernet Interfaces Description

The user can configure descriptions in Ethernet interfaces, as shown below. To display all descriptions, the command `show interface link` can be used.

```
config
interface gigabit-ethernet 1/1/1
description "Link to switch 2"
commit
```

The available commands for troubleshooting can be found in the topic [Verifying Interfaces](#).

6.1.4 Configuring Ethernet Interfaces MTU

It is possible to change an Ethernet interface MTU using the configuration shown below.

```
config
interface gigabit-ethernet 1/1/1
mtu 1500
commit
```

The default MTU value is different for each platform. Refer to the **DmOS Datasheet** to check the maximum values for each hardware platform.

The interface configured MTU value is not used by protocols.

The available commands for troubleshooting can be found in the topic [Verifying Interfaces](#).

6.1.5 Configuring Ethernet Interfaces TPID

The interface TPID can be changed using the configuration shown below.

```
config
switchport
interface gigabit-ethernet 1/1/1
tpid <tpid>
commit
```

The default TPID value is 0x8100.

The allowed TPID values are:

- **0x88a8**: TPID for 802.1ad bridges
- **0x8100**: default TPID for the 802.1Q VLANs

- **0x9100:** Alternative TPID

PDU's originated by protocols like EAPS, ERPS and CFM are sent with the TPID value configured in the interface.

When tagged frames are received with TPID value different from the configured in the interface, the frames are forwarded using native VLAN tag.

There are no troubleshooting commands for this functionality.

6.1.6 Configuring a 10Gbps Interface to operate in 1Gbps

The DmOS allows the use of 1G optical modules in 10G interfaces in two ways:

- **Forced Mode or Non-Negotiated Mode**
- **Negotiated Mode**

The auto-negotiation configuration is disabled by default.

DmOS does not support SFP+ operating at 1G.

To use a 10G interface operating in forced 1G (non-negotiated mode), it is necessary to make the following configurations:

```
config
interface ten-gigabit-ethernet 1/1/1
speed 1G
no negotiation
commit
```

The available commands for troubleshooting can be found in the topic [Verifying Interfaces](#).

To use a 10G interface operating in 1G in the negotiated mode, it is necessary to make the following configurations:

```
config
interface ten-gigabit-ethernet 1/1/1
  advertising-abilities 1Gfull
  negotiation
commit
```

The available commands for troubleshooting can be found in the topic [Verifying Interfaces](#).

6.1.7 Verifying Interfaces

Below are the main commands available to check the feature. If the user is at the config level, the usage of the keyword **do** before the command is required.

For more details about commands output, check the **Command Reference**.

```
show interface <interface-type> <chassis/slot/port>
show interface link
```

6.2 Link Aggregation Configuration

6.2.1 Configuring a LAG in static mode

Link aggregation defined by IEEE 802.3ad allows grouping of Ethernet interfaces to form a single logical interface (LAG). The LAG balances the traffic between the physical interfaces and effectively increases the bandwidth. Another advantage of link aggregation is the increase of link availability between the two equipment. If one of the physical interfaces fails, the LAG will continue to transport traffic using the remaining interfaces.

It is not supported Link Aggregation using different interfaces configuration, for example: VLANs, duplex and speed.

The next steps will indicate how to configure the link-aggregation in a static manner using four (4) Gigabit Ethernet

interfaces, to increase link bandwidth up to 4 Gbps.

```
config
link-aggregation interface lag 1
interface gigabit-ethernet-1/1/1
interface gigabit-ethernet-1/1/2
interface gigabit-ethernet-1/1/3
interface gigabit-ethernet-1/1/4
commit
```

The available commands for troubleshooting can be found in the topic [Verifying Link Aggregation](#).

6.2.2 Configuring a LAG in dynamic mode (LACP)

The LACP (Link Aggregation Control Protocol) is a protocol used to assure the end-to-end connectivity of aggregated interfaces (LAG). It detects and protects the network against incorrect configs, assuring the links are aggregated only if they are configured and cabled correctly. The LACP can be configured in two modes:

- **Active mode:** The device sends immediately LACP (PDUs LACP) messages when the interface is activated.
- **Passive mode:** Places an interface in a passive negotiation status, in which the interface only responds to the PDUs of the LACP that receives, but not initiates negotiation of the protocol.

If at least one of the (endpoints) is set as active, the LAG can be made up assuming a successful negotiation of the other parameters.

Aggregation between interfaces with different VLANs, duplex or speed is not supported.

The next steps will indicate how to configure the dynamic aggregation in active mode using two (2) Gigabit Ethernet, interfaces, totaling a band of 2Gbps to the aggregated link.

```
config
link-aggregation interface lag 1
mode active
interface gigabit-ethernet-1/1/1
interface gigabit-ethernet-1/1/2
commit
```

The available commands for troubleshooting can be found in the topic [Verifying Link Aggregation](#).

6.2.3 Configuring the load balancing

It is possible change the load balancing algorithm to modify traffic forwarding between interfaces in the LAG.

DmOS supports different load balancing modes, with **enhanced** mode the default.

Below is the list of supported balancing modes:

- enhanced
- dst-ip
- dst-mac
- src-dst-ip
- src-dst-map
- src-ip
- src-mac
- dynamic

The **dynamic** balance type provides an evenly load distribution across the LAG members. According with the instant traffic load of each link, flows can be moved from members with heavier load to members with lower load dynamically.

The other types of balancing are hash-based. Fields of the packet are analysed with xor computations to select the output LAG member. In these modes packet order is always maintained.

The balance performance will depend on the variability of the content of these fields. Packets with the same information will be directed to the same output LAG member.

The next steps will indicate how to configure the link-aggregation in a static manner using four (4) Gigabit Ethernet interfaces, to increase link bandwidth up to 4 Gbps. The balancing method used will be **dynamic**.

```
config
link-aggregation interface lag 1
load-balance dynamic
interface gigabit-ethernet-1/1/1
interface gigabit-ethernet-1/1/2
interface gigabit-ethernet-1/1/3
interface gigabit-ethernet-1/1/4
commit
```

The available commands for troubleshooting can be found in the topic [Verifying Link Aggregation](#).

6.2.4 Configuring maximum and minimum number of active links in a LAG

- **Maximum Links:** When configuring up a maximum number of active links it is possible to keep redundant links inactive, in case some active link fails, the redundant link takes over as active.
- **Minimum Links:** When configuring a minimum number of active links, if the number of active links is less than the minimum number of configured links, all Link-Aggregation interfaces will be disabled.

The maximum number of active links by default is 16.

The minimum number of active links by default is 1.

The next steps will demonstrate how to configure Link-Aggregation using two (2) Gigabit Ethernet interfaces with a maximum number of one (1) active link:

```
config
link-aggregation interface lag 1
  maximum-active links 1
  interface gigabit-ethernet-1/1/1
  interface gigabit-ethernet-1/1/2
commit
```

The available commands for troubleshooting can be found in the topic [Verifying Link Aggregation](#).

The next steps will demonstrate how to configure Link-Aggregation using two (2) Gigabit Ethernet interfaces with a minimum of two (2) active links:

```
config
link-aggregation interface lag 1
  minimum-active links 2
  interface gigabit-ethernet-1/1/1
  interface gigabit-ethernet-1/1/2
commit
```

The available commands for troubleshooting can be found in the topic [Verifying Link Aggregation](#).

6.2.5 Verifying Link Aggregation

Below are the main commands available to check the feature. If the user is at the config level, the usage of the keyword **do** before the command is required.

For more details about commands output, check the **Command Reference**.

```
show link-aggregation
show link-aggregation brief
show link-aggregation interfaces
show link-aggregation lacp brief
show link-aggregation lacp extensive
show link-aggregation lacp statistics
```

6.3 Port Mirroring Configuration

The Port Mirroring allows the Switch to copy network packets from one port to another port on a Switch. This functionality is typically used to mirror traffic, allowing the administrator to monitor the performance of the Switch, and can troubleshoot the network by placing a network analyzer or protocol analyzer on the port that is receiving the mirrored data.

6.3.1 Configuring Port Mirroring for received traffic

The next steps will demonstrate how to configure port mirroring to mirror the inbound traffic of the gigabit-ethernet-1/1/1 interface to the gigabit-ethernet-1/1/2 interface.

```
config
monitor
session 1
destination
interface gigabit-ethernet-1/1/2
!
source
interface gigabit-ethernet-1/1/1
rx
!!
!
commit
```

There are no troubleshooting commands for this functionality.

6.3.2 Configuring Port Mirroring for transmitted traffic

The next steps will demonstrate how to configure port mirroring to mirror the outbound traffic of the gigabit-ethernet-1/1/1 interface to the gigabit-ethernet-1/1/2 interface.

```
config
monitor
session 1
destination
interface gigabit-ethernet-1/1/2
|
source
interface gigabit-ethernet-1/1/1
tx
!
!
commit
```

There are no troubleshooting commands for this functionality.

6.3.3 Configuring Port Mirroring for transmitted and received traffic

The next steps will demonstrate how to configure port mirroring to mirror the inbound and outbound traffic of the gigabit-ethernet-1/1/1 interface to the gigabit-ethernet-1/1/2 interface.

```
config
monitor
session 1
destination
interface gigabit-ethernet-1/1/2
|
source
interface gigabit-ethernet-1/1/1
all
!
!
commit
```

There are no troubleshooting commands for this functionality.

6.4 Link Flap Detection Configuration

Link-Flap Detection is a feature that aims to eliminate the side effects of the interminable variation of the link state of a port. This functionality is activated by a certain number of link state changes in a given time interval.

The Link-Flap Detection feature acts by blocking a link when two or more link state change events occur within a configurable time interval. When the port is blocked, state changes are ignored bringing stability to the network. The port will be unlocked after an configurable interval of event free time.

6.4.1 Configuring Link Flap Detection on Ethernet Interface

The next steps will demonstrate how to configure link flap detection of the gigabit-ethernet-1/1/1 interface. In the configuration below, the interface block will occur if 20 state transitions are detected within 60 seconds. If the state transitions stop, after 90 seconds the interface will be unblocked.

```
config
link-flap
interface gigabit-ethernet-1/1/1
  detection transitions 20
  detection interval 60
  detection restore-timeout 90
!
commit
```

The available commands for troubleshooting can be found in the topic [Verifying Link Flap](#).

6.4.2 Verifying Link Flap

Below are the main commands available to check the feature. If the user is at the config level, the usage of the keyword **do** before the command is required.

For more details about commands output, check the **Command Reference**.

```
show link-flap
show link-flap config-interval
show link-flap config-restore-timeout
show link-flap config-transitions
show link-flap detected-transitions
show link-flap detection-timeout
show link-flap restore-timeout
show link-flap link-flap
```

7 GPON

The GPON uses a WDM (Wavelength Division Multiplexing) technology, allowing the bidirectional transmission on a single fiber (wave length different for downstream and upstream). To segregate traffic of several users, the GPON uses broadcast in the downstream direction (OLT for ONU) and TDMA (Time Division Multiple Access), in the upstream direction (ONU for OLT).

As the data is transmitted from OLT to ONU, the ONUs (Optical network units) should filter the user data traffic as well as coordinate, multiplexing the signals, the client output in order not to create a conflict with the data of other users.

Since the data packs are transmitted in a broadcast manner for all the ONUs, the GPON standard uses AES (Advanced Encryption Standard) to encrypt the flow of data in the downstream direction (OLT for ONU). The encryption is a safe mean to avoid interception and assure that only the authorized user accesses the information.

Read the Datasheet of the equipment to check if these functionalities are available in your hardware platform.

This chapter contains the following sections:

- [Basic Operation of GPON](#)
- [GPON Profiles](#)
- [GPON Service Type](#)
- [Mapping the Service Port](#)
- [Setting GPON Application](#)
- [Automatic Provisioning of ONUs](#)

7.1 Basic Operation of GPON

7.1.1 Setting the GPON interface

To set a GPON interface, the user should enter in the interface config level. To set a GPON interface located in chassis 1, Slot 1 and Port 1 (1/1/1), the user should use the following command:

```
config
interface gpon 1/1/1
```

By default, all the GPON interfaces are deactivated.

To activate a GPON interface, the user should use the following procedure.

```
config
interface gpon 1/1/1
no shutdown
commit
```

To administratively disable a GPON interface, the user should use the following procedure.

```
config
interface gpon 1/1/1
shutdown
commit
```

By default, the FEC is enabled in the GPON interfaces for flows in the downstream and upstream directions. The user may deactivate it using the following configs:

```
interface gpon 1/1/1
no upstream-fec
no downstream-fec
commit
```

Below are the main commands available to check the feature. If the user is at the config level, the usage of the keyword **do** before the command is required.

```
show interface gpon chassis/slot/port
show interface gpon chassis/slot/port brief
```

7.1.2 Setting the ONUs Authentication Method

The ONU authentication method is a global config of the GPON. Thus, it is applied in all the GPON interfaces.

The default method of authentication is **serial-number**.

The available authentication methods are:

- **serial-number**: Authentication via ONU serial number.
- **password-only**: Authentication with password. The DATACOM ONU password is composed of the ONU serial number without the letters "DA".
Example: If the serial number is DACM12345678 the password for authentication will be CM123456789.
- **serial-number-and-password**: Authentication via serial number plus password combination.

The procedure below indicates how to set the password authentication method.

```
config
gpon 1/1
onu-auth-method password
commit
```

Below are the main commands available to check the feature. If the user is at the config level, the usage of the keyword **do** before the command is required.

```
show gpon chassis/slot
```

7.1.3 Discovering the ONUS

To discover the ONUs that are linked to some GPON ports of the OLT, the user should perform the procedure described below:

```
show interface gpon discovered-onus
```

The SN (Serial Number) of all the ONUs that are not provisioned in OLT shall be informed

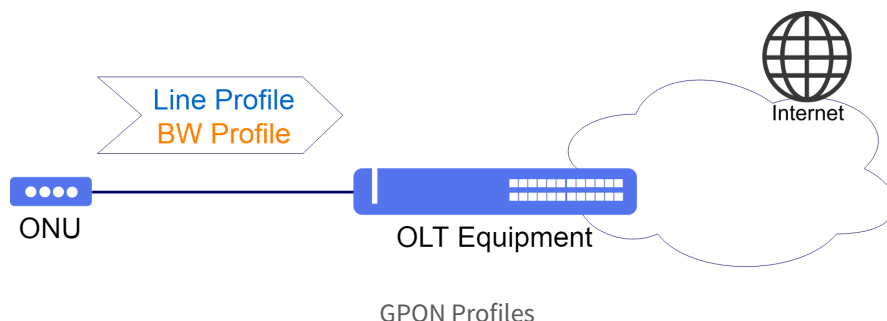

```
# show interface gpon discovered-onus
Chassis / Slot / Port  Serial Number
1/1/1                 DACM00001B30
```

7.2 GPON Profiles

In a typical PON network, there are several end users, but few types of ONU models and services.

Thus, to avoid repetitive provisioning tasks, the GPON profiles allow definition of common attributes that can be reused several times and applied in several service ports.

The figure below is intended to facilitate visualization of where each profile is applied.

After configuring the GPON profiles, they must be associated with the configuration of the ONUs in order for the configured service to operate.

7.2.1 Loading the Default Profiles

It is possible to load the GPON profiles that allow a quick config in the GPON services. It is possible to load the default profiles for ONUs Bridge, for ONUs Router or for both types of ONUs.

To load the default profiles, the user should execute the procedure below:

```
config
load default-gpon-profiles
commit
```

To check the profiles that were loaded, it is possible to execute the show command within the config mode as indicated below:

```
(config)# show profile gpon
profile gpon bandwidth-profile DEFAULT-BANDWIDTH
traffic type-4 max-bw 1106944
!
profile gpon line-profile DEFAULT-LINE
upstream-fec
tcont 1 bandwidth-profile DEFAULT-BANDWIDTH
gem 1
tcont 1 priority 1
map any-ethernet
ethernet any vlan any cos any

statistics-in-bw-usage
statistics-out-bw-usage
!
```

7.2.2 Bandwidth Profile

The bandwidth profile defines the upstream bandwidth allocation characteristics, such as type of T-CONT, fixed bandwidth, bandwidth assured and maximum bandwidth, according to the table below.

BW Type	Delay Affected	Types of applicable T-CONT				
		Type1	Type2	Type3	Type4	Type5
Fixed	Yes	X				X
Assured	No		X	X		X
Non-Assured	No			X		X
Best-Effort	No				X	X

BW Type	Delay Affected	Types of applicable T-CONT				
		Type1	Type2	Type3	Type4	Type5
Max	No			X	X	X

Types of Bandwidth vs Types of applicable T-CONT

The commands below provide an example covering creation of a profile that sets a type 3 T-CONT, with 2 Mbit/s of assured band and 10 Mbit/s of maximum band. Only bands multiple of 64 Kbit/s are allowed.

```
config
profile gpon bandwidth-profile <BANDWIDTH_PROFILE_NAME>
traffic type-3 assured-bw 2048 max-bw 9984
commit
```

7.2.3 Line Profile

This profile is used to associate GEM ports to a T-CONT and map a GEM port with ONU services. The GEM port represents a flow of data, which should be associated to a band profile.

Configuration for bridge ONU

The following commands provide an example covering definition of a band profile for a traffic arriving at the Ethernet 1 interface with VLAN ID 100:

```
config
profile gpon line-profile <LINE_PROFILE_NAME>
tcont 1 bandwidth-profile <BANDWIDTH_PROFILE_NAME>
gem 1
tcont 1
map <MAPPING_NAME>
  ethernet 1 vlan 100 cos any
commit
```

Configuration for router ONU

The following commands provide an example covering definition of a band profile for a traffic arriving at the VEIP 1 interface with VLAN ID 100:

```
config
profile gpon line-profile <LINE_PROFILE_NAME>
tcont 1 bandwidth-profile <BANDWIDTH_PROFILE_NAME>
gem 1
tcont 1
map <MAPPING_NAME>
  veip 1 vlan 100 cos any
commit
```

7.2.4 SIP Agent Profile

The SIP Agent profile defines the IP addresses of the servers for the POTS service that will record an analogical line and will control the call process. There are three services to set.

- **Register Server:** This is the server that accepts REGISTRATION requests and places the information received in these requests in the location service for the domain with which it handles.
- **Proxy Server:** It is an intermediary entity that actuates as a server and a client with the objective to submit requests in name of other clients. A proxy server basically performs the role of routing, which means that its job is to assure that a request be sent to another entity "nearest" to the targeted user.
- **Outbond Proxy:** The outbound proxy receives the request of a client, even if it is not the server resolved by the request URI.

The SIP Agent Profile is only valid for ONUs that have POTS interface.

If the user wishes to define a SIP Agent profile in a POTS interface, it should use the following commands:

```
config
profile gpon sip-agent-profile <SIP_AGENT_PROFILE_NAME>
  registrar <REGISTRAR_IP_ADDRESS>
  proxy-server <PROXY_SERVER_IP_ADDRESS>
  outbound-proxy <OUTBOUND-PROXY-IP-ADDRESS>
commit
```

7.2.5 SNMP Profile

The SNMP profile defines which objects (OIDs) will be available for consultation at the ONU through the SNMP manager. After configuring the SNMP profile, it should be added in the ONU configuration in the GPON interface.

Below is a list of some objects that can be enabled for SNMP query through the ONU.

For the other objects that can be configured, see the Command Reference manual.

- **if-admin-status:** Administrative status of the interface.
- **if-descr:** Description of the interface.
- **if-name:** Interface name.
- **if-onu-power-rx:** Received optical power.
- **if-onu-power-tx:** Transmitted optical power.

- **if-onu-sysuptime:** OUN uptime.
- **if-oper-status:** Operational status of the interface.
- **if-type:** IANA global interface type.
- **statistics-in-bw-usage:** Input used bandwidth on Ethernet UNI.
- **statistics-out-bw-usage:** Output used bandwidth on Ethernet UNI.

Enable the SNMP agent for queries in OLT. Refer to chapter [SNMP Configuration](#)

If user want to define an SNMP profile for the ONUs, it should use the following commands:

```
config
profile gpon snmp-profile <GPON-SNMP-PROFILE>
if-type
if-descr
if-oper-status
if-onu-power-rx
statistics-in-bw-usage
statistics-out-bw-usage
commit
```

7.2.6 GEM Traffic Agent Profile

This service is used to apply a limit of Downstream rate in the ONU. It is important for the ISP (Internet Service Provider) to allow the DHCP authentication with the limit of traffic of the network according to the subscription. The GEM traffic profile defines the CIR and EIR band for an ONU.

- **CIR - Committed Information Rate:** This is the rate in Kbps assured to pass through the interface.
- **EIR - Excess Information Rate:** This is the additional rate in Kbps, in case of bandwidth availability, the ONU traffic will be allowed to reach CIR + EIR.

If the user would like to set a GEM traffic profile, which is set together with the T-CONT, which in turn was declared in the line profile, such user should use the following commands:

```
config
profile gpon gem-traffic-profile <GEM_TRAFFIC_PROFILE_NAME>
cir <COMMITTED-RATE>
eir <EXCESS-RATE>
profile gpon line-profile <LINE_PROFILE_NAME>
tcont 1 bandwidth-profile <BANDWIDTH_PROFILE_NAME>
gem 1
tcont 1 gem-traffic-profile <GEM_TRAFFIC_PROFILE_NAME>
commit
```

7.2.7 Residential Gateway Profile (RG-Profile)

The RG profile defines the router characteristics that should be set in the ONUs. This profile implements a DATACOM proprietary solution and should be used only with DATACOM ONU models DM984-42x with router function.

It is possible to set three main types of connections:

- **wan-pppoe-connection:** PPPoE WAN connection setup. Each connection represents a WAN connection at the ONU. Used for ONU PPPoE authentication.
- **wan-ip-connection:** Configures a default gateway address for the related IP connection in the RG Profile. Used for ONU IP communication.
- **wan-bridge-connection:** WAN bridge connection configuration. Each connection represents a ONU WAN bridge connection. Used for LAN-to-LAN scenarios.

It is allowed to configure **ip-filtering** within the wan-pppoe-connection and wan-ip-connection connections. This setting is **optional**, but will be available in the configuration examples that follow.

wan-pppoe-connection

If the user would like to set a Residential Gateway profile for application with **PPPoE authentication** in ONU's WAN using the **VLAN 2000**, it should set a **wan-pppoe-connection** in the RG-Profile. The procedure below shall indicate how to carry out this config:

```
config
profile gpon rg-profile PPPoE
wan-pppoe-connection PPPoE
vlan-mux vlan 2000
nat
no fullcone-nat
firewall
no multicast-proxy igmp
no multicast-source igmp
auth-type auto
ip-filtering 0
incoming
match protocol tcp
action permit
!
commit
```

wan-ip-connection

If the user would like to set a Residential Gateway profile for IP application with **DHCP authentication** in ONU's WAN using the **VLAN 2100**, it should set a **wan-ip-connection** in the RG-Profile. The procedure below shall indicate how to perform this config:

```
config
profile gpon rg-profile DHCP
wan-ip-connection DHCP
vlan-mux vlan 2100
nat
no fullcone-nat
firewall
no multicast-proxy igmp
no multicast-source igmp
```

```

ipv4 dhcp
primary-dns 10.0.1.1
secondary-dns 10.0.1.2
ip-filtering 1
  incoming
  match protocol tcp-udp
  action permit
!
commit

```

wan-bridge-connection

If the user would like to set a Residential Gateway profile for **LAN-to-LAN** application using the **VLAN 520** in the eth1 interface of the ONU, it should set a **wan-bridge-connection** in the RG-Profile. The procedure below shall indicate how to perform this config:

```

config
profile gpon rg-profile RG-ROUTER-520
wan-bridge-connection VLAN-520
  vlan-mux vlan 520
  no multicast-source igmp
  itf-grouping
  igmp-snooping
  ports eth1 vlan 520
commit

```

7.2.8 TR-069 ACS Profile

The Auto Configuration Server (ACS) provides a feature of automatic provisioning of services using the TR-069 protocol. To provide a configuration of an ONU via ACS, it is necessary that the ONU supports the TR-069 protocol. Once the ACS server is configured with parameters to be provisioned in ONU, the ONU must know how to reach the ACS server. This information is provided by OLT via OMCI through the **tr069-acs-profile** where is contained a configuration of ACS server URL, username and password.

- **URL:** TR-069 server address.
- **Username:** TR-069 server username.
- **Password:** TR-069 server password.

To perform the creation of an ACS profile, use the following commands:

```

config
profile gpon tr069-acs-profile <ACS_PROFILE_NAME>
  url <ACS-URL>
  username <ACS-USERNAME>
  password <ACS-PASSWORD>

```

Once defined, the ACS profile must be applied to the ONUs that need to use automatic provisioning services. The following commands show the process of creation of an ACS profile and their application in a specific ONU:

```

config
profile gpon tr069-acs-profile TR-069
  url http://tr-069-server.internal:17000
  username datacom
  password datacom1234

```

```
interface gpon 1/1/1 onu 0
tr069-acis-profile TR-069
commit
```

ONU must support provisioning via the TR-069 protocol. Before using, verify the product documentation to make sure if the ONU supports configuration via TR-069 protocol.

one-shot-provisioning

The routing parameters that can not be configured through Residential Gateway profiles can be configured via the ONU WEB interface. However, after every ONU reboot, these alterations are lost due to the characteristic of reprovisioning of Residential Gateway profiles after every ONU startup, overwriting the WEB interface configurations. To make these configurations permanent, it is possible to enable the option of **rg-one-shot-prov**. The procedure below shall indicate how to carry out this config:

```
config
gpon 1/1
rg-one-shot-prov
commit
```

Activating the configuration of **rg-one-shot-prov**, all of the new ONUs activated will have the configuration made via WEB interface persisted, preventing the OLT from applying the Residential Gateway profile after every startup of the ONUs. The ONUs that were configured before the activation of the command **rg-one-shot-prov** only will have the configuration persistent after a reboot or a reprovisioning of the Residential Gateway profile. This operation can be done using the following command:

```
config
interface gpon 1/1/12 onu 4
rg-reprovision
```

The command **rg-reprovision** is applied in the ONU configuration level and it is not necessary to commit.

The command **rg-reprovision** must be executed when it is necessary to make a Residential Gateway profile reapplication in the ONU. When the customer realizes a wrong configuration via WEB interface or performs a reset in the ONU configurations are examples of when this command needs to be executed to recover the ONU default functionalities.

The ONUs configured before the activation of the command **rg-one-shot-prov** presents the status field **RG One Shot Provision** with the information **Not provisioned**, indicating that the configurations done via WEB interface can be lost when the ONU restarts. The following example shows this information:

```
show interface gpon 1/1/12 onu 4
Last updated      : 2019-09-27 12:05:54 UTC-3
ID                : 4
Serial Number     : DACM00009C5C
Password         :

7.3 GPON Service Type

It is possible to set several GPON applications between the OLT and the ONUs. The DmOS supports three main types of services:

7.3.1 Service VLAN N:1

- **N:1:** In general, this type of service is implemented to provide access to Internet to residential clients, since only one VLAN is used to transport the internet service in the entire network.

The following command will set a VLAN for the N:1 service. This means that the clients (N) in the same VLAN (1) shall not be able to communicate one with the other.

```
config
service vlan 100 type n:1
commit
```

7.3.2 Service VLAN 1:1

- **1:1:** In general, this type of service is implemented to provide corporate applications or access to residential internet, since a different VLAN is used to transport the service of each client through the network. Each class of traffic of the same subscriber should have a same VLAN.

The following command will set a VLAN for the 1:1 service. This means that the clients in the same VLAN shall not be able to communicate one with the other.

```
config
service vlan 100 type 1:1
commit
```

7.3.3 Service VLAN TLS

- **TLS:** In general, this type of service is implemented to provide corporate applications, since a different VLAN is used to transport the service of each client through the network. Each class of traffic of the same subscriber can have a same or a different VLAN. This service when used together with the Hairpin enables offer of LAN-to-LAN services and no additional equipment will be required (for example routers).

The following command will set a VLAN for the TLS service. This means that the clients in the same VLAN shall be able to communicate one with the other.

```
config
service vlan 100 type tls
commit
```

7.4 Mapping the Service Port

A service port is used to establish a relationship between the traffic of GEM port and the service VLAN.

Examples of applications with Service Port:

7.4.1 Service Port - Transparent

For example, the traffic originating from VLAN ID 100 at the ONUs will be routed transparently through the following command:

```
config
service-port 1 gpon 1/1/1 onu 1 gem 1 match vlan vlan-id 100 action vlan replace vlan-id 100
commit
```

7.4.2 Service Port - Replace

For example, the traffic resulting from VLAN ID 100 in the ONUs will be mapped for the Service VLAN 200 using the following commands:

```
config
service-port 1 gpon 1/1/1 onu 1 gem 1 match vlan vlan-id 100 action vlan replace vlan-id 200
commit
```

7.4.3 Service Port - Add

For example, the traffic originating from VLAN ID 100 at ONUs will receive a new tag VLAN 1000 through the following command:

```
config
service-port 1 gpon 1/1/1 onu 1 gem 1 match vlan vlan-id 100 action vlan add vlan-id 1000
commit
```

A service-port that uses an N:1 VLAN service only supports the replace operation.

7.5 Setting GPON Application

To configure a GPON application with ONU (bridge/router), follow the steps below:

- **Configure VLAN**
- **Configure Service VLAN**
- **Enable the GPON interface**
- **Verify ONU Discovery**
- **Configure the bandwidth-profile**
- **Configure the line-profile**
- **Configure the RG Profile (only for ONU router)**

- **Provisionar a ONU**
- **Configure the Service Port**

7.5.1 Configuring a N:1 Application with ONU bridge

Considering that the user would like to set two customers with the same band profile. For this example, the N:1 type of service will be set exemplifying the supply of Internet access to the residential clients. The VLAN 100 will be used as a service VLAN.

The scenario below will be used to indicate the config of the service using the Ethernet interface of the ONUs.

Implementing an Internet Access Service using the Service-VLAN N:1

Below is the complete configuration for the N:1 bridge ONU application:

```

config
dot1q
vlan 100
interface gigabit-ethernet-1/1/1
!
service vlan 100 type n:1
!
profile gpon bandwidth-profile DEFAULT-BANDWIDTH
traffic type-4 max-bw 1106944
!

no shutdown
!
service-port 1 gpon 1/1/1 onu 1 gem 1 match vlan vlan-id 100 action vlan replace vlan-id 100
service-port 2 gpon 1/1/1 onu 2 gem 1 match vlan vlan-id 100 action vlan replace vlan-id 100
!
commit

```

7.5.2 Configuring a 1:1 Application with ONU bridge

Considering that the user would like to set two customers with the same band profile. For this example, the 1:1 type of service will be set exemplifying the supply of Internet access. The VLAN 100 will be used as the ONU 1 service VLAN and the VLAN 200 as the ONU 2 service VLAN.

The scenario below will be used to indicate the config of the service using the Ethernet interface of the ONUs.

Implementing an Internet Access Service using the Service-VLAN 1:1

Below is the complete configuration for the 1:1 bridge ONU application:

```

config
dot1q
vlan 100,200
interface gigabit-ethernet-1/1/1
!
service vlan 100 type 1:1
!
service vlan 200 type 1:1
!
profile gpon bandwidth-profile DEFAULT-BANDWIDTH
traffic type-4 max-bw 1106944

line-profile LINE-2
ethernet 1
negotiation
no shutdown
!
service-port 1 gpon 1/1/1 onu 1 gem 1 match vlan vlan-id 100 action vlan replace vlan-id 100
service-port 2 gpon 1/1/1 onu 2 gem 1 match vlan vlan-id 200 action vlan replace vlan-id 200
!
commit
  
```

7.5.3 Configuring a TLS Application with ONU router

Considering that the user wishes to configure a LAN-to-LAN application for protocol transparency and the possibility of the clients communicating with each other. For this example, the TLS service type will be configured by exemplifying the delivery of enterprise applications. The VLAN 100 will be used as a service VLAN.

The scenario below will be used to indicate the config of the service using the VEIP interface of the ONUs DATACOM model DM98x.

Implementing an Corporate Service using the Service-VLAN TLS

it is necessary to configure an RG Profile so that the settings are sent to UN DM98x.

The main change over the for ONU bridge is in the configured interface type which goes from **ethernet** to **veip**.

Below the complete configuration for the application TLS with ONU router model DM98x.

```

config
dot1q
vlan 100
interface gigabit-ethernet-1/1/1
!
service vlan 100 type tls
!
profile gpon bandwidth-profile DEFAULT-BANDWIDTH
traffic type-4 max-bw 1106944
!
profile gpon line-profile DEFAULT-LINE
upstream-fec

no multicast-source igmp
itf-grouping
igmp-snooping
ports eth1 vlan 100
!
interface gpon 1/1/1
no shutdown
onu 1
name CLIENTE-1
serial-number DACM00000001
rg-profile RG-DM98x
line-profile DEFAULT-LINE
veip 1
!
!
onu 2
name CLIENTE-2
  
```

```

serial-number DACM00000002
rg-profile RG-DM98x
line-profile DEFAULT-LINE
veip 1
!
service-port 1 gpon 1/1/1 onu 1 gem 1 match vlan vlan-id 100 action vlan replace vlan-id 100
service-port 2 gpon 1/1/1 onu 2 gem 1 match vlan vlan-id 100 action vlan replace vlan-id 100
!
commit

```

7.6 Automatic Provisioning of ONUs

The automatic provisioning tool is used to set in an automatic manner all the ONUs discovered in the OLT based on a set of pre-defined profiles. The config is performed in a global manner and will apply the config defined in the automatic provisioning to all the discovered ONUs.

The GPON created profiles should be included in the automatic provisioning and also it is possible to use the loaded default profiles.

Implementing an Internet Access Service using the Service-VLAN N:1

Assume that the user wants all ONU that are discovered in the PON branch to be automatically configured with the profiles previously configured.

The following procedure presents the configuration required to enable provisioning automatic.

```

config
gpon 1/1
onu-auto-provisioning
enable
line-profile <DEFAULT-LINE>
service-port 1 gem 1 match vlan vlan-id <VLAND-ID> action vlan add vlan-id <VLAND-ID>
!
commit

```

The service-port should be created for each GEM that the user wishes to set. It is possible to set up to 16 service-ports in the automatic provisioning, which will be applied in all the discovered ONUs.

Below is the complete configuration for the application with automatic provisioning:

```

config
dot1q
vlan 100
interface gigabit-ethernet-1/1/1
!
service vlan 100 type n:1
!
profile gpon bandwidth-profile DEFAULT-BANDWIDTH
traffic type-4 max-bw 1106944
!

```

```
profile gpon line-profile DEFAULT-LINE
  upstream-fec
  tcont 1 bandwidth-profile DEFAULT-BANDWIDTH
  gem 1
    tcont 1 priority 0
    map veip
    veip 1 vlan 100 cos any
!
profile gpon snmp-profile DEFAULT-SNMP

8 Switching

In a network of Layer 2, each network segment has its own collision domain and all the segments are in the same transmission domain. The entire transmission is seen by all the network devices. The 802.1Q standard allows creation of VLANs that are used to segment a single broadcast domain into several broadcast domains.

The 802.1Q standard supports frames tagged from identifier 1 to 4094.

This chapter contains the following sections:

- [MAC Table Configuration](#)
- [VLAN Configuration](#)
- [RSTP Configuration](#)
- [MSTP Configuration](#)
- [EAPS Configuration](#)
- [ERPS Configuration](#)
- [L2CP Configuration](#)
- [Loopback Detection Configuration](#)
- [DHCP Relay L2 Configuration](#)

8.1 MAC Table Configuration

8.1.1 Configuring Aging Time

The switching equipment operate in L2 layer and execute forwarding of frames through MAC addresses. The MAC address table stores the MAC addresses caught by the device, associating them to an interface port.

The MAC addresses are caught dynamically or statically by the device. In static mode, the user saves an input with MAC address and port. This input shall persist in the table until it is removed by the user. In the dynamic mode, the switch receives a frame and saves the MAC address of origin and the interface port in the table. This address will continue saved while a traffic exist or will wait for the aging time to clean this input in the table. The standard value of the aging time is 600 seconds.

The next steps will indicate how to set the aging time for the value of **300** seconds.

```
config
mac-address-table aging-time 300
commit
```

The available commands for troubleshooting can be found in the topic [Verifying MAC Address Table](#).

8.1.2 Disabling MAC learning

MAC learning in interfaces is enabled by default. If that is not desirable, it can be disabled per interface.

Disabling MAC learning in an interface can result in frame flooding, causing frames to be forwarded unnecessarily.

The commands below show how to disable MAC learning in the interface gigabit-ethernet 1/1/6.

```
config
mac-address-table interface gigabit-ethernet-1/1/6 learning disabled
commit
```

The available commands for troubleshooting can be found in the topic [Verifying MAC Address Table](#).

8.1.3 Verifying MAC Address Table

Below are the main commands available to check the feature. If the user is at the config level, the usage of the keyword **do** before the command is required.

For more details about commands output, check the **Command Reference**.

```
show mac-address-table
show mac-address-table interface <INTERFACE>
show mac-address-table mac-address <MAC_ADDRESS>
show mac-address-table type <STATIC/DYNAMIC>
show mac-address-table vlan <VLAN_ID>
show running-config mac-address-table interface learning
```

8.2 VLAN Configuration

8.2.1 Configuring VLAN with Tagged Interfaces

The **tagged** mode is used in the interfaces that perform the output and input of traffic with VLAN ID (802.1Q) tag.

The next steps will define how to set the VLAN 200 for output of data traffic between the Gigabit Ethernet 1/1/1 and Gigabit Ethernet 1/1/2 interfaces using the tagged mode.

```
config
dot1q
vlan 200
interface gigabit-ethernet-1/1/1 tagged
interface gigabit-ethernet-1/1/2 tagged
```

By default, if the user does not specify the interface mode in the VLAN, the mode used will be **tagged**.

It is also possible for the user to set several VLANs using a range and inserting the desired interfaces. The procedure below exemplifies config of a range of VLANs from ID 1500 through ID 2000 with the ten-gigabit-ethernet 1/1/1 interface in tagged mode.

```
config
dot1q
vlan 1500-2000
name TRAFEGO
interface ten-gigabit-ethernet-1/1/1 tagged
commit
```

The available commands for troubleshooting can be found in the topic [Verifying VLAN Configuration](#).

8.2.2 Configuring VLAN with Untagged Interfaces

The untagged mode is used in the interfaces that perform the output and input of traffic and that do not have the VLAN ID (802.1Q) tag. This mode is used mainly in the interfaces connected to computers, servers, printers, etc.

For the untagged traffic, setting of a native-vlan in the interfaces using the switchport config is required

The next steps will define how to set the VLAN 200 for traffic between the Gigabit Ethernet 1/1/1 and Gigabit Ethernet 1/1/2 interfaces using the untagged mode.

```
config
dot1q
vlan 200
interface gigabit-ethernet-1/1/1 untagged
interface gigabit-ethernet-1/1/2 untagged
!
switchport
interface gigabit-ethernet-1/1/1
native-vlan
vlan-id 200
!
```

```
interface gigabit-ethernet-1/1/2
 native-vlan
 vlan-id 200
 commit
```

The available commands for troubleshooting can be found in the topic [Verifying VLAN Configuration](#).

8.2.3 Configuring VLAN Translate

The VLAN-Translate performs replacement of a given VLAN by another VLAN in the out direction or in the in direction of the traffic.

Implementation of VLAN Translate

The next steps will indicate how to set the VLAN Translate to translate the VLAN 100 into the VLAN 400 in the input (in) of the gigabit ethernet 1/1/1 interface and execute the opposite operation in the output (out).

VLAN-Translate configuration is done through the VLAN mapping functionality, using the action **replace**.

```
config
dot1q
vlan 400
interface gigabit-ethernet-1/1/1
!
Interface gigabit-ethernet-1/1/2
!
!
vlan-mapping
interface gigabit-ethernet-1/1/1
 ingress
  rule TRANSLATE-ingress-rule1
  match vlan vlan-id 100
  action replace vlan vlan-id 400
 egress
  rule TRANSLATE-egress-rule1
  match vlan vlan-id 400
  action replace vlan vlan-id 100
commit
```

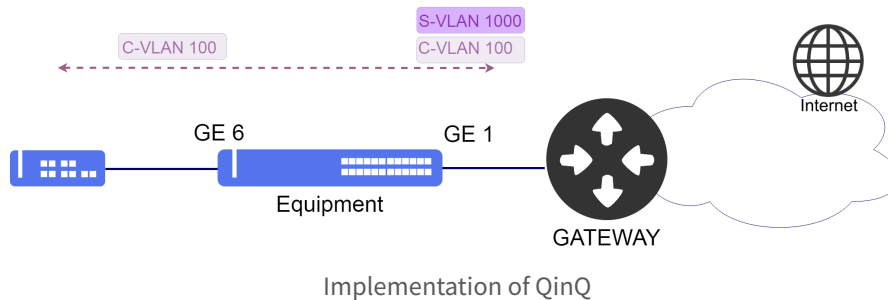

There are no troubleshooting commands for this functionality.

8.2.4 Configuring QinQ

The QinQ is a L2 functionality also known as tunneling QinQ, 802.1Q tunnel, VLAN Stacking or double-tag. With this functionality, a service provider can assign different service VLANs (S-VLANs) to a given type of different clients traffic, or even a single VLAN to all the clients. This allows a separation between the traffic of each client in the service provider's network. The client's VLANs are then transported in a transparent manner within the service provider's network.

The scenario below will be used to illustrate the config of the QinQ.

The next steps will indicate how to set the QinQ to transport one client connected to the Gigabit-Ethernet-1/1/6 interface. The client have a **VLAN (C-VLAN) 100** and will be transported through the service provider's network with the **VLAN (S-VLAN) 1000**.

To set the QinQ it is necessary to set the interface in an untagged manner and activating the option qinq using the switchport config.

```
config
dot1q
vlan 1000
interface gigabit-ethernet-1/1/1 tagged
interface gigabit-ethernet-1/1/6 untagged
!
switchport
interface gigabit-ethernet-1/1/6
qinq
native-vlan vland-id 1000
commit
```

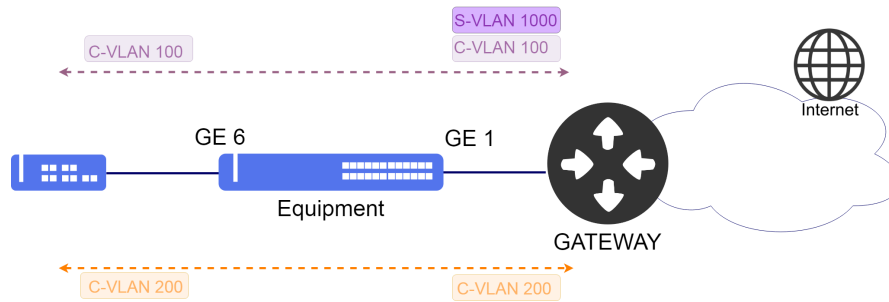

There are no troubleshooting commands for this functionality.

8.2.5 Configuring Selective QinQ

The selective QinQ has the same logic of the standard QinQ, however it adds a new VLAN in the traffic that enters in an interface only for the specified VLAN (C-VLANs) of clients. This functionality has as objective to create service VLANs (S-VLANs) to separate clients (C-VLANs) that diverge in the type of contracted service, such as for example the QoS.

The scenario below will be used to illustrate config of the selective QinQ.

Implementation of Selective QinQ

Considering that the user would like to set two different customers. Both connected to the gigabit-ethernet-1/1/6 interface, however, the client with a VLAN 100 (C-VLAN) will be transported in a transparent manner within the service provider's network through the VLAN 1000 (S-VLAN) and the second client will have the VLAN 200 (C-VLAN) maintained. The next steps will indicate how to set the selective QinQ.

To set the selective QinQ, config of a rule in the vlan-mapping using the option **add** is required.

```
config
dot1q
vlan 200
interface gigabit-ethernet-1/1/1 tagged
interface gigabit-ethernet-1/1/6 tagged
!
vlan 1000
interface gigabit-ethernet-1/1/1 tagged
interface gigabit-ethernet-1/1/6 untagged
!
vlan-mapping
interface gigabit-ethernet-1/1/6
ingress
rule qinq-seletivo-vlan-100
match vlan vlan-id 100
action add vlan vlan-id 1000
commit
```

There are no troubleshooting commands for this functionality.

8.2.6 Verifying VLAN Configuration

Below are the main commands available to check the feature. If the user is at the config level, the usage of the keyword **do** before the command is required.

For more details about commands output, check the **Command Reference**.

```
show vlan brief
show vlan detail
show vlan membership detail
```

8.3 RSTP Configuration

The RSTP (Rapid Spanning Tree Protocol) protocol defined by IEEE 802.1w is used to provide a single path in the network, eliminating loops among equipment.

The BPDU of the RSTP are forwarded without presence of VLAN (untagged).

8.3.1 Configuring a Basic RSTP

The scenario below will be used to illustrate config of the RSTP.

Implementation of RSTP

Considering that the user would like to execute the following configs:

- **Equipment A:** VLAN ID 100 and 200 for traffic with a gigabit-ethernet-1/1/3 interface as access interface.
- **Equipment B:** VLAN ID 100 and 200 for traffic with a ten-gigabit-ethernet-1/1/1 interface as uplink interface.

```
!Equipment A
config
dot1q
vlan 100
interface gigabit-ethernet-1/1/1 tagged
interface gigabit-ethernet-1/1/2 tagged
interface gigabit-ethernet-1/1/3 tagged
!

```

```
interface gigabit-ethernet-1/1/2 tagged
interface ten-gigabit-ethernet-1/1/1 tagged
!
vlan 200
interface gigabit-ethernet-1/1/1 tagged
interface gigabit-ethernet-1/1/2 tagged
interface ten-gigabit-ethernet-1/1/1 tagged
!
!
!
spanning-tree
interface gigabit-ethernet-1/1/1
interface gigabit-ethernet-1/1/2
commit
```

8.3.2 Applying RSTP parameters

If necessary, the user can change Spanning Tree default parameters or enable parameters that are not available in the Spanning Tree default configuration.

Below the list of parameters that can be modified at the Spanning Tree interfaces:

- **auto-edge:** If do not receive BPDUs, the interface goes automatically to edge port state and will not transmit BPDUs.
- **edge-port:** When configured, the interface will not transmit BPDUs. The default value is auto-edge.
- **bpdu-guard:** The interface goes to forwarding state but will not transmit BPDUs, unless a BPDU is received by interface. This command only applies to interfaces that have already been configured as edge-port.
- **cost:** Allows to change the cost of the interface path for STP calculations. By default, this value is associated with the link speed.
- **link-type:** Configure the interface to inform whether the LAN segment is point-to-point or point-multipoint. The default value is auto.
- **port-priority:** Configure the port priority to change the probability of becoming a root port. The default value is 128.
- **restricted-role:** Settings the interface to not be selected as the Root Port of an STP topology.
- **restricted-tcn:** Settings the interface to not propagate the notifications received from changing the STP topology.

The next steps will demonstrate how to configure edge-port on interface gigabit-ethernet-1/1/1.

To configure the other parameters listed above, the procedure is the same as in the example below.

```
config
spanning-tree
interface gigabit-ethernet-1/1/1 edge-port
commit
```

The available commands for troubleshooting can be found in the topic [Verifying RSTP](#).

8.3.3 Verifying RSTP

Below are the main commands available to check the feature. If the user is at the config level, the usage of the keyword **do** before the command is required.

For more details about commands output, check the **Command Reference**.

```
show spanning-tree
show spanning-tree brief
show spanning-tree detail
show spanning-tree extensive
```

8.4 MSTP Configuration

The MSTP (Multiple Spanning Tree Protocol) protocol defined by IEEE 802.1s is used to provide a single path in the network, eliminating loops among equipment. The protocol has advantage over RSTP of providing a load balancing through of different MSTI instances by tuning the ports costs for efficient load balancing.

The protected VLAN group in a MSTI can only overlap with the VLAN group protected by the EAPS and ERPS protocols if the VLANs are exactly the same.

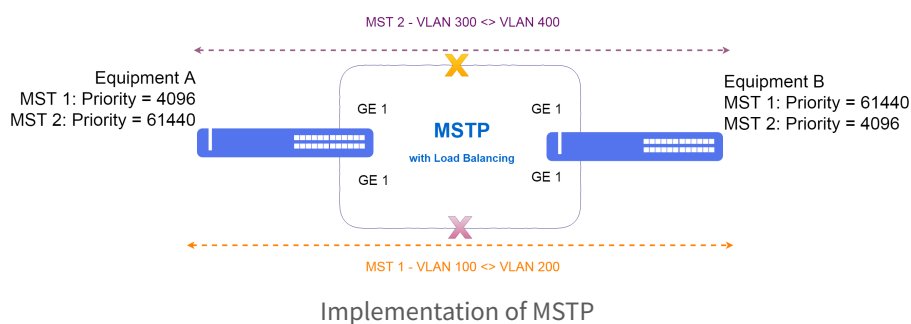

There can be no overlap of VLANs between MSTIs.

The Control VLANs of ERPS and EAPS can not be part of a MSTI.

8.4.1 Configuring MSTP for load balancing

The scenario below will be used to illustrate config of the RSTP for efficient load balancing.

Considering that the user would like to execute the following configs:

- **Equipment A: MST 1:** Priority 4096 and VLAN ID 100 to 200. **MST 2:** Priority 61440 and VLAN ID 300 to 400.
- **Equipment B: MST 1:** Priority 61440 and VLAN ID 100 to 200. **MST 2:** Priority 4096 and VLAN ID 300 to 400.
Port-priority = 32 in ten-gigabit-ethernet-1/1/2.

The both equipment use the ten-gigabit-ethernet 1/1/1 and ten-gigabit-ethernet 1/1/2 interfaces to form MSTP topology with the following parameters: **name = datacom** and **revision = 12345**.

The parameters **name** and **revision** MUST be the same on all equipment that participate in MSTP topology.

The interfaces present in the CIST are required in MSTI instances only if need to set specific parameters such as **cost** and **priority**.

```
!Equipment A
config
dot1q

8.5 EAPS Configuration

The EAPS (Ethernet Automatic Protection Switching) protocol is used to provide a single path in the network and eliminating loops among equipment. It also provides a quicker convergence in relation to the RSTP protocol.

The EAPS protocol operated adequately only in ring type topologies.

The protected VLAN group in a EAPS instance can only overlap with the VLAN group protected by the MSTP and ERPS protocols if the VLANs are exactly the same.

8.5.1 Configuring a Basic Ring EAPS

The scenario below will be used to illustrate the config of the EAPS.

Implementation of EAPS

Considering that the user would like to execute the following configs:

- **Equipment A:** VLAN 100 for traffic with a gigabit-ethernet-1/1/3 interface as access interface and the VLAN 4094 for VLAN of EAPS control in transit mode using the gigabit-ethernet-1/1/1 and 1/1/2 interfaces.
- **Equipment B:** VLAN 100 for traffic with a ten-gigabit-ethernet-1/1/1 interface as uplink interface and the VLAN 4094 for VLAN of EAPS control in master mode using the gigabit-ethernet-1/1/1 and 1/1/2 interfaces.

```
!Equipment A
config
dot1q
vlan 100
interface gigabit-ethernet-1/1/1 tagged
interface gigabit-ethernet-1/1/2 tagged
interface gigabit-ethernet-1/1/3 tagged

commit
```

The available commands for troubleshooting can be found in the topic [Verifying EAPS](#).

8.5.2 Verifying EAPS

Below are the main commands available to check the feature. If the user is at the config level, the usage of the keyword **do** before the command is required.

For more details about commands output, check the **Command Reference**.

```
show eaps
show eaps brief
show eaps detail
```

8.6 ERPS Configuration

The ERPS (Ethernet Ring Protection Switching) protocol defined by rule ITU-U G.8032 is used to provide a single path in the network avoiding and eliminating loops among equipment.

Inhibition of loop in an Ethernet ring is carried out assuring that a segment remains without passing of traffic, this means, barred. The ERPS protocol uses a port called RPL Owner responsible for barring the entire traffic, except the control packs of the protocol.

Currently, the DmOS supports the ERPS protocol only in config in main ring. There is no support for the sub-ring with shared-link.

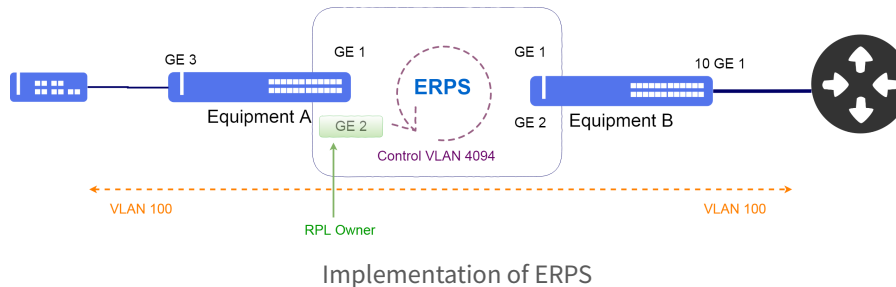

It is mandatory to configure "ring-id 1" if it is necessary to interoperate with other DATACOM products and other vendors that have ERPSv1.

The protected VLAN group in a ERPS instance can only overlap with the VLAN group protected by the EAPS and MSTP protocols if the VLANs are exactly the same.

8.6.1 Configuring a Basic Ring ERPS

The scenario below will be used to illustrate the config of the ERPS.

Considering that the user would like to execute the following configs:

- **Equipment A:** VLAN 100 for traffic with a gigabit-ethernet-1/1/3 interface as access interface and the VLAN 4094 for control VLAN of ERPS and a gigabit-ethernet-1/1/2 interface as RPL Owner.
- **Equipment B:** VLAN 100 for traffic with a ten-gigabit-ethernet-1/1/1 interface as uplink interface and the VLAN 4094 for control VLAN of the ERPS.

```
!Equipment A
config
dot1q
vlan 100
interface gigabit-ethernet-1/1/1 tagged
interface gigabit-ethernet-1/1/2 tagged
interface gigabit-ethernet-1/1/3 tagged

!
!
commit
```

The available commands for troubleshooting can be found in the topic [Verifying ERPS](#).

8.6.2 Verifying ERPS

Below are the main commands available to check the feature. If the user is at the config level, the usage of the keyword **do** before the command is required.

For more details about commands output, check the **Command Reference**.

```
show erps
show erps brief
```

8.7 L2CP Configuration

The L2CP (Layer 2 Control Protocol) protocol is used to provide LAN-to-LAN service in a transparent manner through a network in such a way that the central equipment of the network do not process the PDUs.

The L2CP is supported only in Switch platforms.

The DmOS supports the **L2CP** in the **extended** mode and for **LACP, LLDP, Marker, OAM, PVST and STP** protocols.

The L2CP extended mode is proprietary, for interoperability use the L2CP by protocol.

The L2CP configured by protocol has precedence over extended mode.

8.7.1 Configuring L2CP in extended mode

The L2CP extended mode can tunnel the following MAC address:

PDU Type	MAC Address
IEEE	01:80:C2:00:00:0X e 01:80:C2:00:00:2X
EAPS	00:E0:2B:00:00:04
RRPP	00:0F:E2:07:82:XX
Cisco Protocols	01:00:0C:CC:XX:XX e 01:00:0C:CD:XX:XX

The scenario below will be used to illustrate the config of the L2CP protocol in extended mode. This configuration is used when two private networks of the same customer are connected by ISP network and this customer requires that L2 protocols run like one network between the private networks.

Implementation of L2CP

Considering that the user would like to use the following configs in both equipment:

- VLAN ID 100 for Customer 1 with gigabit-ethernet-1/1/1 interface as access interface and ten-gigabit-ethernet-1/1/1 interface as uplink interface. The L2CP is activated in the access interface.

```
config
dot1q
vlan 100
interface ten-gigabit-ethernet-1/1/1 tagged
interface gigabit-ethernet-1/1/1 untagged
!
!
switchport
interface gigabit-ethernet-1/1/1
native-vlan
vlan-id 100
!
!
!
```

```
layer2-control-protocol
interface gigabit-ethernet-1/1/1
  extended action tunnel
commit
```

The available commands for troubleshooting can be found in the topic [Verifying L2CP](#).

8.7.2 Configuring L2CP by Specific Protocol

Using the [Configuring L2CP in extended mode](#) scenario it is possible to change L2CP configuration to use L2CP by Protocol instead L2CP extended mode.

```
config
layer2-control-protocol interface gigabit-ethernet-1/1/1 lacp action tunnel
layer2-control-protocol interface gigabit-ethernet-1/1/1 lldp action tunnel
layer2-control-protocol interface gigabit-ethernet-1/1/1 marker action tunnel
layer2-control-protocol interface gigabit-ethernet-1/1/1 oam action tunnel
layer2-control-protocol interface gigabit-ethernet-1/1/1 pvst action tunnel
layer2-control-protocol interface gigabit-ethernet-1/1/1 stp action tunnel
layer2-control-protocol interface ten-gigabit-ethernet-1/1/1 lacp action tunnel
layer2-control-protocol interface ten-gigabit-ethernet-1/1/1 lldp action tunnel
layer2-control-protocol interface ten-gigabit-ethernet-1/1/1 marker action tunnel
layer2-control-protocol interface ten-gigabit-ethernet-1/1/1 oam action tunnel
layer2-control-protocol interface ten-gigabit-ethernet-1/1/1 pvst action tunnel
layer2-control-protocol interface ten-gigabit-ethernet-1/1/1 stp action tunnel
```

In case of interoperability with other vendor which use destination MAC (01:00:0C:CD:CD:D0) in L2CP feature use the command below.

```
config
layer2-control-protocol tunnel-mac interop
commit
```

The available commands for troubleshooting can be found in the topic [Verifying L2CP](#).

8.7.3 Configuring L2CP Extended PDU transparency

It is possible enable L2CP Extended PDU transparency using the command below. This feature is used to forward PDUs from one port to another without change any PDU information, because of this all equipment in path needs support PDU transparency.

It is necessary configure the PDU transparency in all equipment in the path.

Using the [Configuring L2CP in extended mode](#) scenario it is possible to change L2CP configuration to use PDU transparency

instead L2CP tunneling.

```
config
layer2-control-protocol interface gigabit-ethernet-1/1/1 extended action forward
layer2-control-protocol interface ten-gigabit-ethernet-1/1/1 extended action forward
```

The available commands for troubleshooting can be found in the topic [Verifying L2CP](#).

8.7.4 Verifying L2CP

Below are the main commands available to check the feature. If the user is at the config level, the usage of the keyword **do** before the command is required.

For more details about commands output, check the **Command Reference**.

```
show running-config layer2-control-protocol
debug enable l2cp-tunneling
```

8.7.5 PDUs default behavior in OLT platforms

On DM461x platforms that support GPON technology the transparency of L2 PDUs for TLS service (service vlan type TLS) is enabled without the possibility of changing this behavior. For services 1: 1 and N: 1 (service vlan type 1: 1 or n: 1), the transparency of L2 PDUs is disabled without the possibility of changing this behavior.

The table below summarizes the transparency behavior of L2 PDUs on DM461x platforms for each type of GPON service.

PDU Type	MAC Address	TLS Service	Service N:1 or 1:1
IEEE	01:80:C2:00:00:0X and 01:80:C2:00:00:2X	Forward	Drop
EAPS	00:E0:2B:00:00:04	Forward	Forward
ERPS	01:19:A7:<ring-id>	Forward	Forward
RRPP	00:0F:E2:07:82:XX	Forward	Forward
Cisco Protocols	01:00:0C:CC:XX:XX and 01:00:0C:CD:XX:XX	Forward	Forward

8.7.6 PDUs default behavior in Switch platforms

In Switch platforms actions **tunnel** and **forward** are supported. The table below summarizes the default tunneling behavior of PDUs if L2CP is not configured.

PDU Type	MAC Address	Default Action
IEEE	01:80:C2:00:00:0X and 01:80:C2:00:00:2X	Drop
EAPS	00:E0:2B:00:00:04	Forward
ERPS	01:19:A7:<ring-id>	Forward
RRPP	00:0F:E2:07:82:XX	Forward
Cisco Protocols	01:00:0C:CC:XX:XX and 01:00:0C:CD:XX:XX	Forward

8.8 Loopback Detection Configuration

Loopback Detection (LBD) detects a loop sending periodically PDUs in an interface and check if PDUs are received in the same interface. If the loop is detected, the following actions will occur:

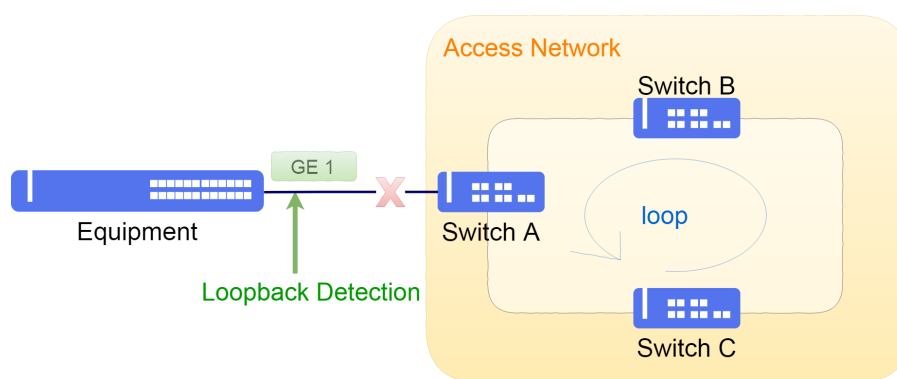

- The interface is blocked.
- An alarm is activated.
- A log is recorded.
- A SNMP trap is sent to the configured SNMP server.

Loopback Detection configuration is not supported on LAG member ports.

8.8.1 Configuring Loopback Detection for access network

In the scenario below, as shown, a loop occurs in access network connected to the equipment. Packets sent from an interface are sent back to this interface.

Scenario with loop

The next steps will demonstrate how to enable loopback detection on an interface.

```
config
loopback-detection
interface gigabit-ethernet-1/1/1
commit
```

The available commands for troubleshooting can be found in the topic [Verifying Loopback Detection](#).

8.8.2 Verifying Loopback Detection

Below are the main commands available to check the feature. If the user is at the config level, the usage of the keyword **do** before the command is required.

For more details about commands output, check the **Command Reference**.

```
debug enable loopback-detection
show alarm
```

8.9 DHCP Relay L2 Configuration

The DHCP Relay L2 executes snooping of DHCP packs for security and subscribers' management purposes, maintaining control of the IP assigned by a reliable DHCP server to the non-reliable network devices. The DHCP option 82 attached by the retransmission agent can be used to maintain tracking of the user and provide a network config based on the network clients' locations.

The standard config has the DHCP as deactivated.

Currently, the DHCP Relay functionality is available only in the DM461x platforms with support to the GPON technology.

To enable the DHCP Relay in VLAN 20 the user would perform the following procedure:

```
config
dhcp relay vlan 20
commit
```

The available commands for troubleshooting can be found in the topic [Verifying DHCP Relay](#).

8.9.1 Verifying DHCP Relay

Below are the main commands available to check the feature. If the user is at the config level, the usage of the keyword **do** before the command is required.

For more details about commands output, check the **Command Reference**.

```
show allowed-ip entry-type dhcp
```

9 IP Services

In this chapter, it is shown basic L3 interface configuration, with IPv4 and IPv6 addressing. It also contains IP services configuration.

This chapter contains the following sections:

- IP Addresses Configuration
- IPv6 SLAAC Configuration

9.1 IP Addresses Configuration

The user can configure IPv4 and IPv6 addresses manually in management, loopback and L3 interfaces.

9.1.1 Configuring IPv4 addresses

The following steps show how to configure the IPv4 address **10.10.0.1/30** in L3 interface (VLAN 2).

```
config
dot1q
vlan 2
interface gigabit-ethernet-1/1/1 untagged
!
!
switchport
interface gigabit-ethernet-1/1/1
native-vlan
vlan-id 2
!
!
interface l3 VLAN2
ipv4 address 10.10.0.1/30
lower-layer-if vlan 2
commit
```

The available commands for troubleshooting can be found in the topic [Verifying IP Address](#).

9.1.2 Configuring IPv6 addresses

The following steps show how to configure the IPv4 address **2001::a0a:1/126** in L3 interface (VLAN 2).

```
config
dot1q
vlan 2
interface gigabit-ethernet-1/1/1 untagged
!
!
switchport
interface gigabit-ethernet-1/1/1
native-vlan
vlan-id 2
!
!
interface l3 VLAN2
lower-layer-if vlan 2
```

```
ipv6 enable
ipv6 address 2001::a0a:1/126
commit
```

The available commands for troubleshooting can be found in the topic [Verifying IP Address](#).

9.1.3 Verifying IP Address

Below are the main commands available to check the feature. If the user is at the config level, the usage of the keyword **do** before the command is required.

For more details about commands output, check the **Command Reference**.

```
show ip interface brief
show ipv6 interface brief
```

9.1.4 MTU configuration in L3 interfaces

It is also possible to configure the MTU in L3 interfaces. In this case, the MTU restriction will only be applied to packets in the control plane, or packets directed to the equipment CPU.

```
config
interface l3 VLAN2
ip-mtu 2000
commit
```

There are no troubleshooting commands for this functionality.

9.2 IPv6 SLAAC Configuration

SLAAC (IPv6 Stateless Address Autoconfiguration) allow equipment interfaces to provide IPv6 prefix information to hosts connected to these interfaces without using a DHCPv6 server or manually configuring a IPv6 address.

The SLAAC operation is based on the exchange of messages **RA (Router Advertisement)** and **RS (Router Solicitation)** allowing clients to use the information of those messages to auto-configure their own IPv6 addresses.

SLAAC is available for L3 interfaces and the MGMT interface.

By default, the **lifetime** of RA messages is **1800** seconds. If the interface should not be used as default route, the lifetime must be set to 0. The **lifetime** is not available for MGMT interface because it can not be used as default route.

By default, once the command "ipv6 enable" is configured into an interface, RA messages will start to be sent to all clients in the broadcast domain. The prefix information will only be added into an RA message after the configuration of "ipv6 address <x:x:x:x::y/64>" or "ipv6 nd ra prefix <x:x:x:x::/64>".

For SLAAC to work, it is necessário that the IPv6 has /64 prefix.

The scenario below will be used to illustrate the configuration of SLAAC.

Implementation of SLAAC

Considering that the user would like to use the network prefix **2222::/64** for a specific network. The SLAAC can be enabled in order to propagate this network prefix via **SLAAC-1** L3 interface to all hosts connected to the broadcast domain. The next steps will indicate how to execute this configuration.

```
config
dot1q
vlan 10
interface gigabit-ethernet-1/1/1 untagged
!
!
switchport
interface gigabit-ethernet-1/1/1
native-vlan
vlan-id 10
!
```

```
!  
interface l3 SLAAC-1  
  lower-layer-if vlan 10  
  ipv6 enable  
  ipv6 nd ra prefix 2222::/64  
commit
```

The available commands for troubleshooting can be found in the topic [Verifying IPv6 SLAAC](#).

9.2.1 Verifying IPv6 SLAAC

Below are the main commands available to check the feature. If the user is at the config level, the usage of the keyword **do** before the command is required.

For more details about commands output, check the **Command Reference**.

```
debug enable ipv6-nd-rx  
debug enable ipv6-nd-tx
```

10 Routing

Routing is the process to forward packs to their destination using network addresses. Routing is executed by devices capable to exchange information required to create tables containing path information to reach a destination, using specific protocols or inputs assigned manually.

The dynamic routing protocols, such as the OSPF, gather the required information from the neighboring devices in order to create its routing table, used to define to which location the traffic will be sent.

As alternatives to the dynamic methods, static routes exist. The static routes are recommended in routers that have few networks and less paths for destination.

The information received through the routing protocols are added in a table called RIB (Routing Information Base) that is the base for calculation of definition of best path. The result of the route calculation is the FIB (Forwarding Information Base) that contains information that the devices use to route the traffic.

This chapter contains the following sections:

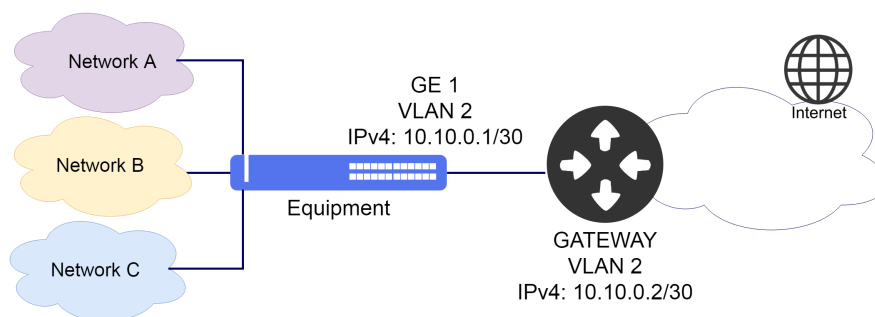

- [Static Routing Configuration](#)
- [VLAN Routing Configuration](#)
- [VRF Configuration](#)
- [OSPFv2 Configuration](#)
- [OSPFv3 Configuration](#)
- [BGP Configuration](#)
- [VRRP Configuration](#)

10.1 Static Routing Configuration

The static routing has as objective to output packs between different networks with the config of the routes in a manual manner by the network administrators.

10.1.1 Configuring a Default Static Route

The scenario below will be used to illustrate the config of the static routing.

Implementation of static routing

Considering that the user would like that the entire traffic be forwarded through the L3 (VLAN 2) interface with IPv4 **10.10.0.1/30** address. In his case, a default route should be set. The next steps will indicate how to execute these configs.

```
config
dot1q
vlan 2
  interface gigabit-ethernet-1/1/1 tagged
  !
!
interface l3 DEFAULT_ROUTE-VLAN2
  ipv4 address 10.10.0.1/30
  lower-layer-if vlan 2
  !
!
router static address-family ipv4 0.0.0.0/0 next-hop 10.10.0.2
commit
```

The available commands for troubleshooting can be found in the topic [Verifying Static Routes](#).

10.1.2 Verifying Static Routes

Below are the main commands available to check the feature. If the user is at the config level, the usage of the keyword **do** before the command is required.

For more details about commands output, check the **Command Reference**.

```
show ip route
show ip route static
show ip rib
show ip rib static
show ip interface brief
```

10.2 VLAN Routing Configuration

By default, different VLANs do not communicate one with the other, since they are in exclusive broadcast domains. In order to have a communication between two VLANs, it is necessary to use a router or a way of routing in the equipment itself. Routing between VLANs allows this communication through config of L3 interfaces associated to the required VLANs. The network associated to L3 interface is inserted in the routing table and can be accessed by other networks.

10.2.1 Configuring a Basic Routing between VLANs

The scenario below will be used to illustrate the config of routing between VLANs.

Implementation of routing between VLANs

Considering that the user would like to set the routing between VLAN 100 that has a L3 interface with 192.168.100.1/24 address and VLAN 200 that has a L3 interface with 192.168.200.1/24 address. The next steps will indicate how to perform these configs.

It is possible to configure secondary IPv4 address on L3 interfaces. Secondary IPv6 address is not supported.

```
config
dot1q
vlan 100
interface gigabit-ethernet-1/1/11 tagged
!
vlan 200
interface gigabit-ethernet-1/1/12 tagged
!
!
interface l3 L3-VLAN100
ipv4 address 192.168.100.1/24
lower-layer-if vlan 100
!
!
interface l3 L3-VLAN200
ipv4 address 192.168.200.1/24
lower-layer-if vlan 200
!
!
commit
```

The available commands for troubleshooting can be found in the topic [Verifying Routes](#).

10.2.2 Verifying Routes

Below are the main commands available to check the feature. If the user is at the config level, the usage of the keyword **do** before the command is required.

For more details about commands output, check the **Command Reference**.

```
show ip route
show ip route connected
show ip interface brief
```

10.3 VRF Configuration

VRF (Virtual Routing and Forwarding) is a feature that allows different routing instances in the same equipment.

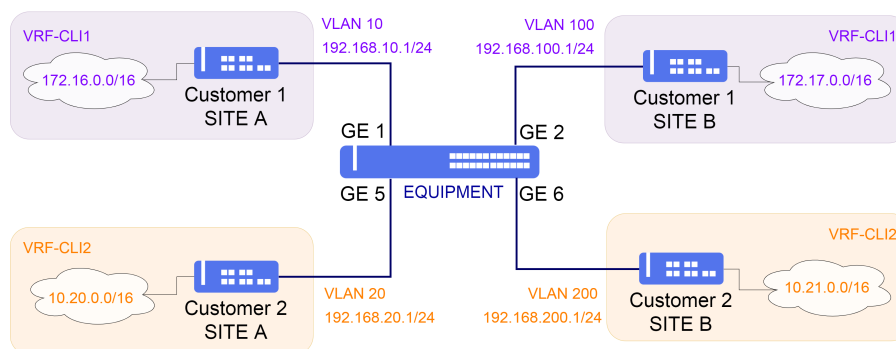

By default, DmOS has two routing tables, global and management. It is possible to create other tables configuring other VRF instances.

To configure the **VRF mgmt** (VRF used exclusively for equipment management), it is necessary to configure the mgmt interface and a default route in the mgmt VRF. By default, the mgmt VRF is already created in DmOS.

10.3.1 Configuring VRF Lite

VRF lite is a basic version of VRF and does not support MPLS signaling. The scenario below will be used to illustrate the config of the VRF Lite.

Implementation of VRF Lite

There must not be communication between clients 1 and 2. Therefore, two VRFs will be configured to isolate the routing tables and traffic between them. The following specifications will be used:

- **VRF-CLI1:**
Interface in VLAN 10 with IPv4 address 192.168.10.1/24
Interface in VLAN 100 with IPv4 address 192.168.100.1/24
- **VRF-CLI2:**

Interface in VLAN 20 with IPv4 address 192.168.20.1/24

Interface in VLAN 200 with IPv4 address 192.168.200.1/24

To create VRFs VRF-CLI1 and VRF-CLI2, just follow the configurations below.

```
config
vrf VRF-CLI1
description CLIENT1
!
vrf VRF-CLI2
description CLIENT2
!
commit
```

Then, interfaces and routes are configured and assigned to these VRFs.

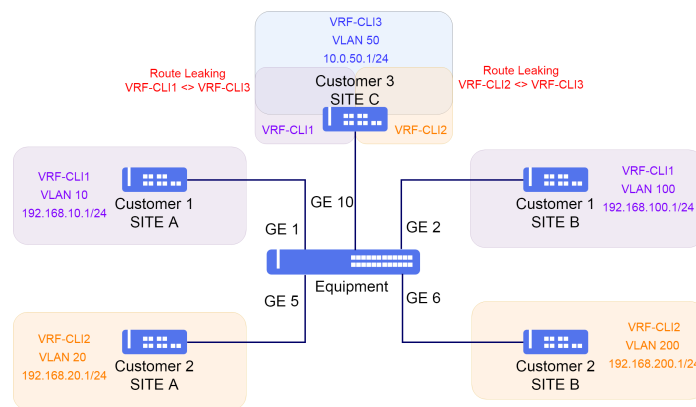

```
config
dot1q
vlan 10
interface gigabit-ethernet-1/1/1 tagged
!
vlan 20
interface gigabit-ethernet-1/1/5 tagged

!
commit
```

The available commands for troubleshooting can be found in the topic [Verifying VRFs](#).

10.3.2 Enabling Route Leaking between VRFs

The previous scenario will be used as base. A third client is included.

Route leaking between VRFs

Client 3 has the following specifications:

- **VRF-CLI3:**
Interface in VLAN 50 with IPv4 address 10.1.50.1/24

Since all the clients are in different VRFs, there is no communication between them. Considering there is a requirement that client 1 and 2 must access client 3, route leaking between VRFs must be used.

Each VRF must have a unique identifier called route distinguisher (RD). The RD is used to identify to which VRF each route belongs, allowing as well IP address overlapping between VRFs. The following RD's will be used:

- **VRF-CLI1:** rd 1:10
- **VRF-CLI2:** rd 2:20
- **VRF-CLI3:** rd 3:50

To enable the leaking, route-targets (RT) are used. Just like RD, RTs are identifiers added to the routes so the router knows which routes to be inserted in which VRFs. RTs can have the same format as the RD. Routes exported with a specific RT will be imported in VRFs that have the same RT configured as import.

It will be configured leaking between VRF-CLI1 and VRF-CLI3 and between VRF-CLI2 and VRF-CLI3, so there will be possible to Client 3 communicate with Client 1 and Client 2 as well. There will not be possible to Client 1 to communicate to Client 2 because they are not configured to import routes between them.

The route leaking between VRFs occurs with the redistribution of static routes and with the redistribution of directly connected routes.

```
config
dot1q
vlan 50
interface gigabit-ethernet-1/1/10 tagged
!
!
interface l3 CLI3-VLAN50

The available commands for troubleshooting can be found in the topic [Verifying VRFs](#).

10.3.3 Verifying VRFs

Below are the main commands available to check the feature. If the user is at the config level, the usage of the keyword **do** before the command is required.

For more details about commands output, check the **Command Reference**.

```
show ip route vrf <VRF_NAME>
show ip fib vrf <VRF_NAME>
```

10.4 OSPFv2 Configuration

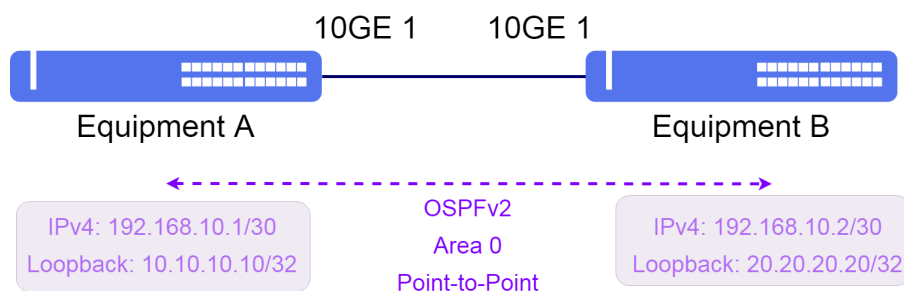

The OSPFv2 (Open Shortest Path First version 2) is the Interior Gateway Protocol described by the RFC 2328 (version 2) for routing of IPv4 addresses. This protocol is used within a same AS (Autonomous System), justifying its denomination of Interior. It is based on Dijkstra algorithm, which calculates the shortest path to each destination based on costs of each link.

Currently, the OSPFv2 supports networks of the point-to-point and broadcast type.

10.4.1 Configuring OSPFv2 Point to Point

The scenario below will be used to illustrate the config of the OSPFv2.

Basic implementation of OSPFv2 protocol

Considering that the user would like to execute an OSPF session in area 0 with network-type of the point-to-point type through the following configs:

- **Equipment A:** L3 Interface in VLAN 1000 with IPv4 192.168.10.1/30 address and loopback interface with IPv4 10.10.10.10/32 being used as router-id in OSPFv2 in area 0.
- **Equipment B:** L3 Interface in VLAN 1000 with IPv4 192.168.10.2/30 address and loopback interface with IPv4 20.20.20.20/32 being used as router-id in OSPFv2 in area 0.

It is recommended to use the **loopback interface** instead of the physical interfaces due to the stability, since they are always active.

```
!Equipment A
config
dot1q
vlan 1000
interface ten-gigabit-ethernet-1/1/1
untagged
!
!
!
switchport
interface ten-gigabit-ethernet-1/1/1

```

The available commands for troubleshooting can be found in the topic [Verifying OSPFv2](#).

10.4.2 Enabling Prefix-List of OSPFv2 routes

It may be required to limit the number of installed routes in some equipment due to hardware capacity restrictions.

In the example below, a prefix-list named *allowed-prefixes* is configured to allow only routes 203.0.113.0 with prefix length between /24 and /32. When that prefix-list is applied to OSPF protocol configuration, only the specified routes are installed. Other received prefixes are kept in the OSPF database, but are not installed in the RIB.

```
prefix-list allowed-prefixes
seq 10
  action permit
  address 203.0.113.0/24
  le 32
!
router ospf 1
import-prefix-list allowed-prefixes

show ip ospf database external
show ip route ospf
show ip rib ospf
```

10.5 OSPFv3 Configuration

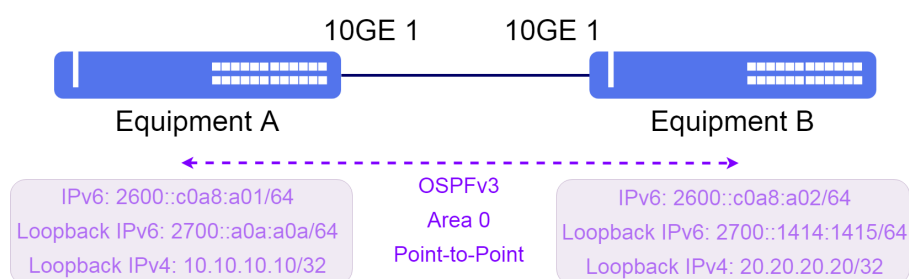

The OSPFv3 (Open Shortest Path First version 3) is the Interior Gateway Protocol described by the RFC 2740 for routing of IPv4 addresses. This protocol is used within a same AS (Autonomous System), justifying its denomination of Interior. It is based on Dijkstra algorithm, which calculates the shortest path to each destination based on costs of the links.

Currently, the OSPFv3 supports only networks of the point-to-point type.

10.5.1 Configuring OSPFv3 Point to Point

The scenario below will be used to illustrate the config of the OSPFv3.

Basic implementation of OSPFv3 protocol

Considering that the user would like to execute the following configs:

- **Equipment A:** L3 interface in VLAN 1000 with IPv6 2600::c0a8:a01/64 address and loopback interface with IPv6 2700::a0a:a0a/64 and IPv4 10.10.10.10/32, being used as router-id in the OSPFv3 in area 0.
- **Equipment B:** L3 interface in VLAN 1000 with IPv6 2600::c0a8:a02/64 address and loopback interface with IPv6 2700::1414:1415/64 and IPv4 20.20.20.20/32 being used as router-id in the OSPFv3 in area 0.

It is recommended to use the **loopback interface** instead of the physical interfaces due to the stability, since they are always active.

10.6 BGP Configuration

The BGP (Border Gateway Protocol) protocol is the protocol used for exchange of routing information between the AS (autonomous-system) in Internet. Upon establishing a neighborhood with a different AS, the BGP is called **eBGP** (external BGP) while when the neighborhood is established between routers of the same AS, the BGP is called **iBGP** (internal BGP).

10.6.1 Configuring a eBGP IPv4 Single Homed

The scenario below will be used to indicate the config of BGP protocol with IPv4 addresses in different AS, this means, eBGP.

Basic implementation of BGP IPv4 protocol

Considering that the user would like to execute the following configs:

- **Equipment A:** L3 Interface in VLAN 2000 with IPv4 192.168.20.1/30 address and loopback interface with IPv4 10.10.10.10/32 being used as router-id in BGP with local AS 20000 and remote AS 40000.
- **Equipment B:** L3 Interface in VLAN 2000 with IPv4 192.168.20.2/30 address and loopback interface with IPv4 20.20.20.20/32 being used as router-id in BGP with local AS 40000 and remote AS 20000.

It is recommended to use the address of the loopback interface instead of the physical interfaces in config of the iBGP neighborhood. On the other side the eBGP is recommended to use the addresses of the physical interfaces instead of the loopback.

```
!Equipment A
config
dot1q
vlan 2000
    interface gigabit-ethernet-1/1/1
        untagged
    !
    !
    !

10.6.2 Configuring route-maps and IPv4 prefix-lists

The configuration above will advertise every valid route present in the BGP RIB and accept any valid route received from the neighbor. In some cases, it may be required to filter the prefixes to avoid sending or receiving unwanted routes.

The export configuration (advertise-filter) will:

- Do not advertise private routes
- Do not advertise routes with prefix length greater than /24
- Advertise routes with prefix length between /16 and /18 with ASN prepend
- Advertise the remaining routes which do not match any of the previous rules

The import configuration (receive-filter) will:

- Do not accept private routes
- Do not accept routes with prefix length greater than /24
- Do not accept routes originated in AS 5678
- Accept remaining routes which do not match any of the previous rules

The **match-as-path** parameter accepts regular expressions. In following configuration, to match AS paths starting with ASN 5678, the used regular expression is `[^0-9]5678$`. `[^0-9]` will not match any number on that specific position, so a match will happen only with 5678 and not 15678, for example.

```

10.6.3 Configuring a iBGP IPv6 Single Homed

The BGP (Border Gateway Protocol) protocol is the protocol used for exchange of routing information between the AS (autonomous-system) in Internet. Upon establishing a neighborhood with a different AS, the BGP is called eBGP (external BGP) while when the neighborhood is established between routers of the same AS, the BGP is called iBGP (internal BGP).

The scenario below will be used to indicate the config of BGP protocol with IPv6 addresses in the same AS, this means, iBGP.

Basic implementation of BGP IPv6 protocol

Considering that the user would like to execute the following configs:

- **Equipment A:** L3 interface in VLAN 2000 with IPv6 2800::c0a8:1401/64 address and loopback interface with IPv6 2700::a0a:a0a/64 and IPv4 10.10.10.10/32 being used as router-id in the BGP with local AS 20000 and remote AS 20000.
- **Equipment B:** L3 interface in VLAN 2000 with IPv6 2800::c0a8:1402/64 address and loopback interface with IPv6 2500::1414:1414/64 e IPv4 20.20.20.20/32 being used as router-id in the BGP with local AS 20000 and remote AS 20000.

It is recommended to use the address of the loopback interface instead of the physical interfaces in config of the iBGP neighborhood. On the other side the eBGP is recommended to use the addresses of the physical interfaces instead of the loopback.

```

10.6.5 Configuring BGP Communities

BGP communities are parameters that can be added to routes advertised by BGP. These parameters can be used to perform actions over the routes, as reject them or change their characteristics.

The topology below will be used to show how to configure BGP communities.

Communities configuration

```

config
dot1q
vlan 100
  interface gigabit-ethernet-1/1/1
  !
vlan 200

```

```

interface gigabit-ethernet-1/1/2
!
!
interface l3 VLAN100
lower-layer-if vlan 100
ipv4 address 192.168.84.1/30
!
!
interface l3 VLAN200
lower-layer-if vlan 200
ipv4 address 192.168.84.5/30
!
!
router bgp 27686
router-id 192.168.0.1
address-family ipv4 unicast
!
neighbor 192.168.84.2
update-source-address 192.168.84.1
remote-as 3549
ebgp-multihop 1
address-family ipv4 unicast
!
!
neighbor 192.168.84.6
update-source-address 192.168.84.5
remote-as 262318
ebgp-multihop 1
address-family ipv4 unicast
!
!
!

```

Among the received prefixes from ASN 3549, prefix 203.0.0.13/24 must be marked with community 3549:1000 before being readvertised.

Among prefixes received from ASN 262318, prefix 198.51.100.0/24 is received with community 27686:501. Prefixes received marked with this community must be readvertised with 2 ASNs prepend.

```

config
prefix-list prefix-203_0_0
seq 10
action permit
address 203.0.0.0/24
!
!
router bgp 27686
route-map import-from-asn3549 10

10.6.6 Verifying BGP

Below are the main commands available to check the feature. If the user is at the config level, the usage of the keyword **do** before the command is required.

For more details about commands output, check the **Command Reference**.

```
show ip bgp
show ip bgp neighbor
show ip bgp prefixes
show ip bgp summary
show ip bgp community
show ip route bgp
show ip rib bgp
show ipv6 route bgp
show ipv6 rib bgp
```

10.7 VRRP Configuration

The VRRP (Virtual Router Redundancy Protocol) has as objective to eliminate the single point of failure, making available one or more equipment to be gateways of a LAN if the main gateway becomes unavailable. The protocol controls the IP addresses associated to a virtual router in which one of the equipment is elected Master and the others are elected Backup.

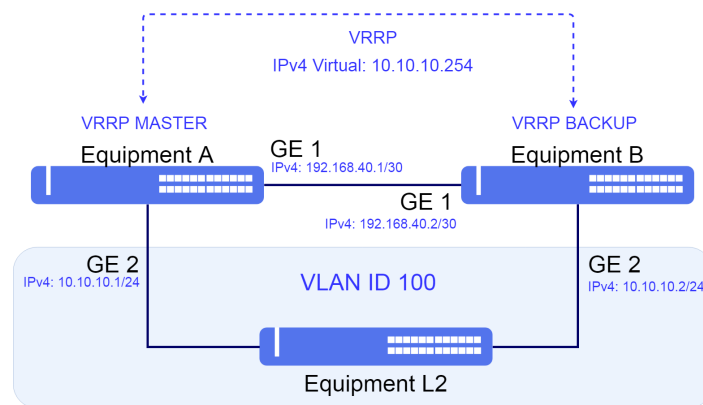

The **VRRPv2** versions are supported (with support to IPv4 addresses, described by the RFC 3768) and **VRRPv3** (with support to IPv4 and IPv6 addresses, described by RFC 5798).

A direct connection between the VRRP routers is recommended to increase the resiliency in case of individual failures of the links. In these direct connections use of the RSTP or of other L2 control protocols should be avoided.

10.7.1 Configuring a VRRPv2 to provide High-Availability

The scenario below will be used to illustrate the config of the VRRPv2 protocol to provide High-Availability.

Basic implementation of VRRP protocol

Considering that the user would like to execute the following configs:

- **Equipment A:** L3 interface for gateway of L2 network in VLAN 100 with IPv4 10.10.10.1/24 address. VRRP in version 2 with IP of Virtual Router 10.10.10.254, priority 250 and authentication with "password" password. Direct connection between routers (A and B) through L3 Interface in VLAN 4000 with IPv4 192.168.40.1/30 address.
- **Equipment B:** L3 interface for gateway of L2 network in VLAN 100 with IPv4 10.10.10.2/24 address. VRRP in version 2 with IP of Virtual Router 10.10.10.254, priority 200 and authentication with "password" password. Direct connection between routers (A and B) through L3 Interface in VLAN 4000 with IPv4 192.168.40.2/30 address

```

11 MPLS

MPLS (Multi-Protocol Label Switching), defined by RFC 3031, based on forwarding of packets by labels. It provides allows traffic engineering and VPNs (Virtual Private Networks). In this chapter, L2VPNs and L3VPNs configuration will be covered.

This chapter contains the following sections:

- LDP Configuration
- VPWS Configuration
- VPLS Configuration
- Enabling FAT in a L2VPN
- Verifying L2VPNs
- L3VPN Configuration

11.1 LDP configuration

LDP (Label Distribution Protocol) is used for label distribution in the MPLS network equipment.

A license is required for MPLS operation. For more details on how to activate it, check the topic [Licenses Configuration](#).

The following topology will be used to exemplify LDP configuration.

LDP Configuration

```

11.2 VPWS Configuration

A VPWS (Virtual Private Wire Service) provides the emulation of point-to-point Ethernet services over a MPLS network.

The following topology will be used as base for the examples in this section.

Base topology for VPWS

Loopbacks:

Equipment	Loopback
EQUIPMENT A	198.51.100.1/32
EQUIPMENT B	198.51.100.2/32
EQUIPMENT C	198.51.100.3/32

Addressing between PEs and P:

PE	PE Intf	PE Address	P	P Intf	P Address	VLAN
EQUIP A	TenG1/1/1	203.0.113.1/30	EQUIP C	TenG1/1/2	203.0.113.2/30	10
EQUIP B	TenG1/1/2	203.0.113.5/30	EQUIP C	TenG1/1/1	203.0.113.6/30	20

```

VPN signaling happens through LDP protocol. It is necessary to establish a targeted LDP session between PEs, as show below.

```

!Equipment A
config
mpls ldp
 lsr-id loopback-0
  neighbor targeted 198.51.100.2
!
!
commit

```

```

!Equipment B
config
mpls ldp
 lsr-id loopback-0
  neighbor targeted 198.51.100.1
!
!
commit

```

It is important that the MTU set in the PW for LDP signaling be equal among the two equipment involved in the VPN. If the value of pw-mtu is not specified, the value that will be considered will be the one specified in the AC (access-interface) that by defaults uses 9198 Bytes.

11.2.1 Configuring a PW type VLAN VPWS - Case 1

In the following topology, there is a VPNs with tagged access interfaces. The VLAN tags used in both VPN sites are different.

PW type VLAN configuration

Both access interfaces are *tagged*. It means only frames with the specified VLAN tag will be encapsulated and transported.

In this scenario, site A receives frames with VLAN tag 100 and site B received frames with VLAN tag 200. The received frames in site A (EQUIPMENT A) from CE-A contain tag 100. The frames are forwarded to site B (EQUIPMENT B) and the tags are replaced by tag 200 before forwarding them to CE-B. The received frames with tag 200 from CE-B are forwarded

to site A (EQUIPMENT) and have their targets replaced with tag 100 before being forwarded to CE-A. In this way, the communication between different VLANs in a VPN is possible.

```
!Equipment A
config
mpls l2vpn
vpws-group CUSTOMER1
  vpn VPN1
    neighbor 198.51.100.2
    pw-type vlan
    pw-id 100
    !
  !
  access-interface gigabit-ethernet-1/1/1
  dot1q 100
  !
  !
  !
  !
commit
```

```
!Equipment B
config
mpls l2vpn
vpws-group CUSTOMER1
    vpn VPN1
        neighbor 198.51.100.1
        pw-type vlan
        pw-id 100
    !
!
access-interface gigabit-ethernet-1/1/1
    dot1q 200
!
!
!
commit
```

The available commands for troubleshooting can be found in the topic [Verifying L2VPN](#).

11.2.2 Configuring a VPWS with VLAN PW type - Case 2

In the scenario below, there is a L2VPN with VLAN pw type and dot1q access interface in site A and untagged access interface in site B.

VPWS configuration with VLAN PW type

VPN signaling happens through LDP protocol. It is necessary to establish a targeted LDP session between PEs, as shown below.

```
!Equipment A
config
mpls ldp
  lsr-id loopback-0
  neighbor targeted 198.51.100.2
  !
  !
  !
commit
```

```
!Equipment B
config
mpls ldp
  lsr-id loopback-0
  neighbor targeted 198.51.100.1
  !
  !
  !
commit
```

Site A access interface is *tagged* and allows only frames with tag 50 to be encapsulated and transported. In site B, the access interface is untagged.

The received frames with tag 50 from CE-A are forwarded to site B (EQUIPMENT B) and have their tags removed before being forwarded to CE-B. Before being forwarded to site A (EQUIPMENT A), tag 200 is added to the untagged frames received from CE-B. Tag 200 is replaced with tag 50 in EQUIPMENT A before being forwarded to CE-A.

```
!Equipment A
config
mpls l2vpn
  vpls-group CUSTOMER2
  vpn VPN2
  neighbor 198.51.100.2
  pw-type vlan
  pw-id 200
  !
  !
  !
  access-interface gigabit-ethernet-1/1/1
  dot1q 50
  !
  !
  !
commit
```

```
!Equipment B
config
mpls l2vpn
  vpls-group CUSTOMER2
  vpn VPN2
  neighbor 198.51.100.1
  pw-type vlan 200
  pw-id 200
  !
  !
  !
  access-interface gigabit-ethernet-1/1/1
  !
  !
  !
commit
```

The available commands for troubleshooting can be found in the topic [Verifying L2VPN](#).

11.2.3 Configuring a VPWS with Ethernet PW type - Case 1

In the following scenario, there is a PW type Ethernet VPN. Interfaces do not have dot1q configured. In this case, the VPN becomes *port-based*. Any frame, with any VLAN tag, will be encapsulated and forwarded through the VPN.

PW type Ethernet VPN configuration

```
!Equipment A
config
mpls l2vpn
vpws-group CUSTOMER1
vpn VPN3
neighbor 198.51.100.2
pw-type ethernet
pw-id 102
!
!
access-interface gigabit-ethernet-1/1/1
!
!
!
commit
```

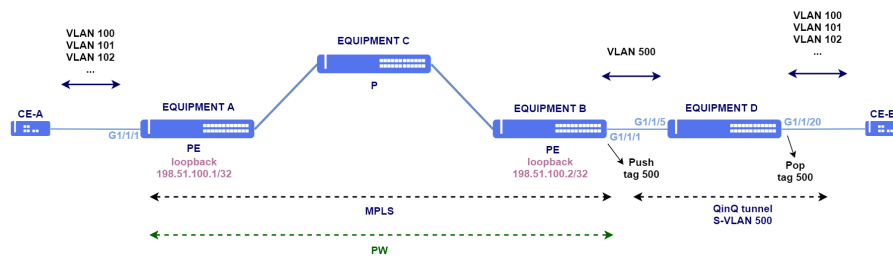

```
!Equipment B
config
mpls l2vpn
vpws-group CUSTOMER1
vpn VPN3
neighbor 198.51.100.1
pw-type ethernet
pw-id 102
!
!
access-interface gigabit-ethernet-1/1/1
!
!
!
commit
```

The available commands for troubleshooting can be found in the topic [Verifying L2VPN](#).

11.2.4 Configuring a VPWS with Ethernet PW type - Case 2

In the following topology, there is a Ethernet PW VPN. In site A, frames with several VLAN tags are expected. Site B is connected to EQUIPMENT D, a switch configured to work only as layer 2 and encapsulate frames in S-VLAN 500. All transported VLANs are encapsulated in VLAN 50 in site B.

Configuring PW type Ethernet VPN and QinQ

Site A must be configured with Ethernet PW type and as *port-based* mode. Site B must be configured with Ethernet PW type as well and VLAN-based mode (*tagged*), so the 500 tag is pushed to the frame in the egress.

```
!Equipment A
config
mpls l2vpn
vpws-group CUSTOMER1
vpn VPN4
neighbor 198.51.100.2
pw-type ethernet
pw-id 103
!
!
access-interface gigabit-ethernet-1/1/1
!
!
!
commit
```

```
!Equipment B

```

The available commands for troubleshooting can be found in the topic [Verifying L2VPN](#).

11.3 VPLS Configuration

VPLS (Virtual Private LAN Service) is a L2VPN service that interconnects networks in different sites through an IP/MPLS network, making them in the same broadcast domain. VPLS emulates a point-to-multipoint Ethernet service.

The following topology will be used as base for the examples in this section.

VPLS topology

Loopbacks:

Equipment	Loopback
EQUIPMENT A	198.51.100.1/32
EQUIPMENT B	198.51.100.2/32
EQUIPMENT C	198.51.100.3/32
EQUIPMENT D	198.51.100.4/32

11.3.3 Configuring a H-VPLS

Hierarchical VPLS (H-VPLS) divides a VPLS in a backbone domain and edge domains, reducing the number of PWs.

The following topology exemplifies a VPLS in which PEs establish one PW with a single main equipment, simplifying the configuration and decreasing the number of signaled PWs.

As shown in section VPWS Configuration, it is possible to combine VLAN-based and port-based interfaces to achieve the desired behavior of the VPLS.

H-VPLS

access-interface gigabit-ethernet-1/1/3
!
!
!
!
commit
```

The available commands for troubleshooting can be found in the topic [Verifying L2VPN](#).

11.4 Enabling FAT in a L2VPN

L2VPNs are usually considered as a unique flow by LAG (Link Aggregation) hashing mechanisms, which will result in the traffic not being balanced satisfactorily. The *Flow-Aware Transport* (FAT) has as objective the increase of traffic entropy by adding a new label called *Flow Label*. The new label will help LAG hashing algorithm to make a more efficient load balance.

FAT can be enabled on packet reception, packet transmission or both. If the neighbor is not configured accordingly, the VPN will be established but the FAT feature will be disabled.

In the example below, FAT is configured in a VPWS. Also it is possible to set FAT in VPLS.

```
mpls l2vpn
vpws-group VPWS-DATACOM
vpn VPN1
neighbor 20.20.20.20
pw-type vlan
pw-load-balance
flow-label both
!
pw-id 10
!
access-interface gigabit-ethernet-1/1/5
dot1q 100
!
commit
```

11.5 Verifying L2VPN

Below are the main commands available to check the feature. If the user is at the config level, the usage of the keyword **do** before the command is required.

For more details about commands output, check the **Command Reference**.

```
show mpls l2vpn hardware
show mpls l2vpn vpws-group brief

show mpls ldp parameters
show mpls forwarding-table
```

11.6 L3VPN Configuration

11.6.1 Configuring a L3VPN Site-to-Site

While L2VPN provides transparent layer 2 services, in L3VPN the routing is performed by ISP equipment. Packets are forwarded using MPLS labels. BGP is the protocol used to exchange route and label information between PEs.

Each route is identified by a route-distinguisher (RD), which must be unique for each client, allowing IP addresses overlapping between different customers. Routes are marked with BGP communities called route-targets, which are used to define in which VPN each route will be installed.

It is mandatory to have LDP protocol configured and running in the network to be able to use L3VPN service.

Despite the route-distinguisher format being similar to the route-target format, both are independent and have different functions.

BGP is responsible for label and route exchange between PEs. It is necessary to enable the VPNv4 family in BGP protocol.

In the following topology, two PEs (EQUIPMENT A and EQUIPMENT B) will be configured. In EQUIPMENT A, there is an interface with IP address 192.168.10.1/24 connected to a CE (Site A). In EQUIPMENT B, there are two interfaces with IP addresses 192.168.20.1/24 and 192.168.30.1/24, connected to another two CEs (Site B and Site C). The equipment A and B have loopback addresses 1.1.1.1/32 and 2.2.2.2/32 respectively. The directly connected networks will be redistributed between the PEs. The PEs are connected by gigabit-ethernet-1/1/5 interface using OSPF and LDP protocols to provide the infrastructure for L3VPN through of AS1000.

11.6.2 Configuring a L3VPN Hub and Spoke

In a hub-and-spoke topology, different CEs (Hub, Site A and Site B) can access a central site but cannot communicate between themselves directly.

In the topology below, sites A e B should have connectivity to the central site, but they should not be able to communicate between them. Sites A e B traffic will be Always forwarded to the hub. For that to happen, it is necessary to have two VPNs, one between the hub and site A and another between site B and the hub.

As all traffic will be forwarded to the hub, it will be able to control the routing between sites.

In the following topology, the PEs (EQUIPMENT A and EQUIPMENT B) are connected by gigabit-ethernet-1/1/5 interface and PEs (EQUIPMENT A and EQUIPMENT C) are connected by gigabit-ethernet-1/1/6 interface using OSPF and LDP protocols to provide the infrastructure for L3VPN through of AS1000.

11.6.3 Configuring BGP between PEs and CEs

In order to avoid the configuration of static routes in PEs (EQUIPMENT A, B and C), it is recommended to use a routing protocol between PEs and CEs (Hub, Site A and Site B) for route distribution. In the following topology, BGP will be used. CEs are in AS 65000 and the PEs are in AS 1000.

OSPF protocol can also be used between CE and PE for route redistribution, as shown in [Configuring OSPF between PEs and CEs](#).

eBGP Session between PE and CE

```

The available commands for troubleshooting can be found in the topic [Verifying L3VPNs](#).

11.6.4 Enabling AS Override

In some scenarios, it could be necessary to change the AS PATH to avoid that the BGP loop detection mechanism discard received prefixes. AS Override can be used for that.

```

router bgp 1000
  vrf cli1
    neighbor 192.168.30.2
      address-family ipv4 unicast
      as-override
      exit-address-family

```

```
!
commit
```

11.6.5 Enabling Allow AS In

Allow AS In can also be used to allow loops in AS PATH in the PE.

```
router bgp 1000
vrf cli1
neighbor 192.168.30.2
address-family ipv4 unicast
allow-as-in 1
exit-address-family
!
commit
```

11.6.6 Configuring OSPF between PEs and CEs

In order to avoid the configuration of static routes in PEs (EQUIPMENT A, B and C), it is recommended to use a routing protocol between PEs and CEs (Hub, Site A and Site B) for route distribution. In the following topology, OSPF will be used.

BGP protocol can also be used between PEs and CEs for route redistribution, as shown in [Configuring BGP between PEs and CEs](#).

OSPF between PEs and CEs in L3VPN

To advertise routes received via MP-BGP from other PEs to CEs, **redistribute bgp** command must be configured in the OSPF configuration.

To advertise routes received from CEs via OSPF to PEs via MP-BGP, **redistribute ospf** command must be configured in BGP configuration.

```

show ip fib vrf <vrf-name> brief
show ip interface vrf <vrf-name> brief
```

12 Multicast

This chapter describes the multicast protocols configuration. It contains the following sections:

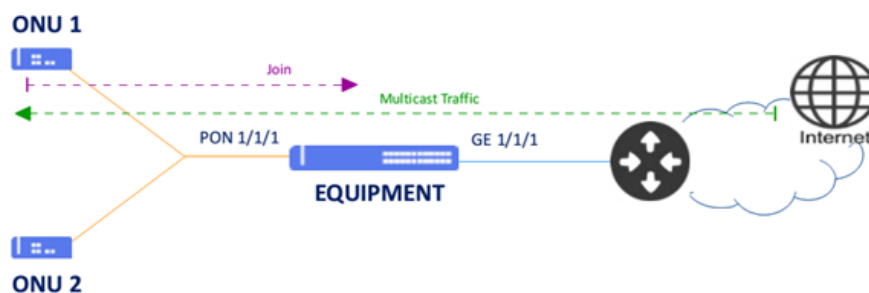

- IGMP Snooping Configuration

12.1 IGMP Snooping Configuration

The IGMP Snooping (Internet Group Management Protocol) protocol analyses the packets of IGMP protocol within a VLAN in order to discover which interfaces have an interest in receiving the multicast traffic. Using the information obtained by the protocol, the IGMP Snooping reduces consumption of bandwidth in a LAN, avoiding sending per flood to devices that do not wish to receive multicast flows.

12.1.1 Configuring IGMP Snooping in GPON Application

The scenario below will be used to describe a multicast application with IGMP Snooping.

Implementation of IGMP Snooping for Multicast traffic

Setting of a GPON service prior to application of the following configs is required. And, it is possible to execute the config using an Ethernet interface as access interface instead of a service-port of GPON interface.

The next steps will indicate how to set the IGMP Snooping in **VLAN 3000** for inspection of multicast traffic in the gigabit 1/1/1 interface and in ONU 1 that is set in service-port 1.

```
config
dot1q
vlan 3000
interface gigabit-ethernet-1/1/1 tagged
interface service-port-1
!
!
multicast igmp snooping 1
bridge-domain id 3000
interface gigabit-ethernet-1/1/1
interface service-port 1
commit
```

The available commands for troubleshooting can be found in the topic [Verifying IGMP](#).

12.1.2 Verifying IGMP

Below are the main commands available to check the feature. If the user is at the config level, the usage of the keyword **do** before the command is required.

For more details about commands output, check the **Command Reference**.

```
show multicast igmp snooping groups
show multicast igmp snooping groups brief
show multicast igmp snooping groups detail
show multicast igmp snooping groups extensive
show multicast igmp snooping mrouter
show multicast igmp snooping statistics
```

13 QoS

The QoS (Quality of Service) is a set of mechanisms and algorithms used to classify and organize the traffic in the network. The main objective is to assure that the services that need transmission quality in the network (latency, jitter and bandwidth), for example: voip or multicast operate in an adequate manner.

This chapter contains the following sections:

- Congestion Control Configuration
- Traffic Shapping Configuration
- Traffic Policing Configuration

13.1 Congestion Control Configuration

13.1.1 Configuring WFQ Scheduler

The WFQ (Weighted Fair Queuing) is a scheduler that defines weights for the queues providing a band for each queue in congestion conditions. The queue when set as SP shall consume the entire band available and only the excess will be divided between the other queues with calculation based on the weight of each one.

The next steps will define how to set the WFQ in the gigabit 1/1/1 interface with the following specifications:

- **Queue 0:** weight 5
- **Queue 1 and 2:** weight 10
- **Queue 3 and 4:** weight 15
- **Queue 5:** weight 20
- **Queue 6:** weight 25
- **Queue 7:** SP (Strict Priority)

```
config
qos scheduler-profile WFQ-Profile-1
mode wfq
queue 0 weight 5
queue 1 weight 10
queue 2 weight 10
queue 3 weight 15
queue 4 weight 15
queue 5 weight 20
queue 6 weight 25
queue 7 weight SP
!
qos interface gigabit-ethernet-1/1/1 scheduler-profile WFQ-Profile-1
commit
```

There are no troubleshooting commands for this functionality.

13.2 Traffic Shapping Configuration

Traffic Shapping adjusts the traffic rate through the use of a buffer, which will hold packets when they are over the allowed bandwidth, introducing some delay.

13.2.1 Configuring Rate Limit on Interface

The Rate limit is a functionality that limits the maximum rate of traffic and the burst that an interface may output or input.

The rate inserted should be in kbps unit and the burst in KB.

The next steps will indicate how to set the Rate limit in the input with the value of 30 Mbps (30000 kbps) with burst of 2 MB (2000 kB) and in the output with the value of 100 Mbps (100000 kbps) with burst of 2 MB (2000 kB) in the gigabit 1/1/1 interface.

```
config
qos interface gigabit-ethernet-1/1/1
rate-limit
  ingress
    bandwidth 30000
    burst 2000
  !
  egress
    bandwidth 100000
    burst 2000
commit
```

There are no troubleshooting commands for this functionality.

13.3 Traffic Policer Configuration

Policer is one of the functionalities that allow the control of traffic used over an available but finite bandwidth. It is a mechanism of classification and control of flows according to the levels of services desired. The Policer classifies the flows in colors (green, yellow and red) according to the configured rates allowing to take different actions according to the classification made.

The CBS (Committed Burst Size) parameter should be in the **bytes** unit and the CIR (Committed Information Rate) rate in **kbits/s**.

Traffic Policer can be performed based on VLAN, inner-VLAN, PCP, inner-PCP and DSCP.

13.3.1 Configuring Traffic Policing based on VLAN

The next steps will demonstrate how to configure Traffic Policer by limiting the client band using **VLAN 10** for **downloading 15 Mbps** (15000 kbits/s) and uploading 5 Mbps (5000 kbits/s) using **burst 1 MB** (1000000 bytes) by performing the discarding of surplus traffic.

```
config
qos policer
profile download
mode flow
parameters
  cir 15000
  cbs 1000000
!
stage egress

profile download
vlan 10
!
instance upload
interface ten-gigabit-ethernet-1/2/3
profile upload
vlan 10
!
commit
```

There are no troubleshooting commands for this functionality.

13.3.2 Configuring Traffic Policing based on PCP

The next steps will demonstrate how to configure Traffic Policer by limiting the client band using **PCP 5** for **downloading 15 Mbps** (15000 kbits/s) and uploading 5 Mbps (5000 kbits/s) using **burst 1 MB** (1000000 bytes) by performing the discarding of surplus traffic.

```
config
qos policer
profile download
mode flow
parameters
  cir 15000
```

```

! cbs 1000000
!

!
commit

```

There are no troubleshooting commands for this functionality.

13.3.3 Configuring Traffic Policing based on DSCP

The next steps will demonstrate how to configure Traffic Policer by limiting the client band using **DSCP cs1** for **downloading 15 Mbps** (15000 kbits/s) and uploading 5 Mbps (5000 kbits/s) using **burst 1 MB** (1000000 bytes) by performing the discarding of surplus traffic.

```

config
qos policer

```

There are no troubleshooting commands for this functionality.

14 Security

Maintain security in the network consists in adopting access policies, monitoring of resources and protection of the equipment to avoid undesirable attacks.

This chapter describes how to set some security functionalities and resources available in the DmOS. It contains the following sections:

- Storm Control Configuration
- ACL Configuration
- Anti IP Spoofing Configuration
- MAC Limit Configuration

14.1 Storm Control Configuration

The Storm Control is a traffic attack control resource that avoids that the LAN ports become impacted by a broadcast, multicast or unicast traffic attack in the physical interfaces. A traffic attack occurs when the packs overfill the LAN, creating an excessive traffic and degrading network performance.

The value specified for traffic control is a percentage of the rated speed of the interface that can be specified from 0 to 100 in steps of 0.01.

The 100 specification will allow that the entire set type traffic be suppressed.

14.1.1 Configuring Storm Control

The next steps will indicate how to set the Storm Control the interface gigabit 1/1/1 to suppress the broadcast traffic in **95%** of the interface, the multicast traffic in **70%** and the unicast traffic in **5%**.

```
config
switchport
interface gigabit-ethernet-1/1/1
storm-control
broadcast 95
multicast 70
unicast 5
commit
```

The available commands for troubleshooting can be found in the topic [Verifying Storm Control](#).

14.1.2 Verifying Storm Control

Below are the main commands available to check the feature. If the user is at the config level, the usage of the keyword **do** before the command is required.

For more details about commands output, check the **Command Reference**.

```
show interface utilization
show interface <interface> statistics
```

14.2 ACL Configuration

ACLs (Access Control Lists) have the function of permitting or denying packets, protecting the equipment against attacks or avoiding non authorized access in network resources.

DmOS supports ingress ACLs e also ACLs specific for traffic destined to equipment CPU. It is possible to deny or permit packets, or change packets properties.

Each hardware platform supports a maximum number of ACLs. Refer to the **DmOS Datasheet** to check maximum values.

- L2 Filters: Destination and Source MAC, Ethertype, PCP, Inner-PCP, VLAN e Inner-VLAN.
- L3 Filters: L2 Filters, Destination and Source IPv4, TCP/UDP Destination Port, DSCP, IP Protocol e ToS.

14.2.1 Configuring ACL L2 to deny traffic of a VLAN

The next steps will indicate how to set a L2 ACL with priority 0 in the gigabit 1/1/1 interface denying traffic of VLAN 20 in this interface.

```
config
access-list
acl-profile ingress l2 ACL-L2 priority 0
  access-list-entry 0 match vlan 20
  action deny
!
!
access-list interface gigabit-ethernet-1/1/1 ingress ACL-L2
commit
```

The available commands for troubleshooting can be found in the topic [Verifying ACLs](#).

14.2.2 Configuring ACL L3 to deny traffic of IPv4 Address

The next steps will indicate how to set a L3 ACL with priority 256 in the gigabit 1/1/1 interface denying traffic with 192.168.5.10 address of origin in this interface.

```
config
access-list
acl-profile ingress l3 ACL-L3 priority 256
  access-list-entry 0 match source-ipv4-address 192.168.5.10
  action deny
!
access-list interface gigabit-ethernet-1/1/1 ingress ACL-L3
commit
```

The available commands for troubleshooting can be found in the topic [Verifying ACLs](#).

14.2.3 Configuring an ACL for CPU protection

Packets destined to interfaces configured in the equipment (loopbacks as well l3 interfaces) are forwarded for processing in CPU, which can lead to high processing, affecting protocol, or even allowing vulnerabilities to be exploited. For those reasons, it is recommended the use of ACLs for CPU (control plane) protection, allowing only the required packets for troubleshooting (i.e. ICMP, SNMP), management (i.e. SSH) and protocols establishment.

In the example below, a ACL is configured for CPU protecting based on the following criteria:

- Allow ARP packets
- Allow ICMP IPv4 packets
- Allow ICMP IPv6 packets
- Allow SSH access only for packets with source in network 10.0.0.0/24
- Allow OSPF packets (IP protocol 89)
- Allow BGP packets (port 179)
- Allow LDP packets (port 646)
- Drop the remaining packets

The ACL was configured using name **control-plane-protection** and it was applied using the configuration command **configura  o access-list protection cpu control-plane-protection**.

Even having the desired ports permitted in the ACL, it is important that ARP and ICMP IPv6 protocol are permitted as well, as shown in entries 10 and 30 of the following configuration.

```
config
access-list
protection
  cpu control-plane-protection
!
acl-profile cpu l3 control-plane-protection
priority 0
access-list-entry 10
  match ethertype arp
  action permit
!
access-list-entry 20
  match ip-protocol icmp
  action permit
!
access-list-entry 30
  match ip-protocol ipv6-icmp
  action permit
!
access-list-entry 40
  match source-ipv4-address 10.0.0.0/24
  match destination-port ssh
  action permit
!
access-list-entry 50
  match ip-protocol 89
  action permit
!
access-list-entry 60
  match destination-port 179
  action permit
!
access-list-entry 70
  match destination-port 646
  action permit
!
access-list-entry 100
  action deny
!
!
commit
```

The available commands for troubleshooting can be found in the topic [Verifying ACLs](#).

14.2.4 Verifying ACLs

Below are the main commands available to check the feature. If the user is at the config level, the usage of the keyword **do** before the command is required.

For more details about commands output, check the **Command Reference**.

```
show acl-resources
show acl-resources brief
show acl-resources detail
show acl-resources extensive
```

14.3 Anti IP Spoofing Configuration

The anti-ip-spoofing functionality is a technique that consists in protecting the spoofing interfaces in the packs, avoiding attacks of the SYN flood type, routing redirect among others.

It is possible to set rules to allow traffic of a specific IP address, all the IPV4 addresses, all the IPV6 addresses or all the IPv4 and IPv6 addresses.

This security resource is available only in OLT platform with support to the GPON technology.

For the service-port that uses the DHCP or PPPoE as authentication of GPON clients, the IP addresses will be released automatically. This config is not necessary.

It is not possible to deactivate rules in the GPON interfaces. The rules can be applied in Ethernet interfaces or in Service-ports of the GPON.

14.3.1 Configuring Anti IP Spoofing for specific IPv4 and MAC address

The next steps will indicate how to set the anti-ip-spoofing in the gigabit 1/1/3 interface, releasing the IP traffic for the 1.1.1.1 address in service-port 2 with MAC 00:AA:10:20:30:41.

```
config
anti-ip-spoofing
interface service-port-2
  allowed-ip ipv4 1.1.1.1 vlan 10 mac 00:AA:10:20:30:41
```

The available commands for troubleshooting can be found in the topic [Verifying Anti IP Spoofing](#).

14.3.2 Configuring Anti IP Spoofing for specific IPv4 address

The next steps will indicate how to set the anti-ip-spoofing in service-port-2 releasing only the IP traffic for the IPv4 192.10.20.1 address.

```
config
anti-ip-spoofing
interface service-port-2
  allowed-ip ipv4 address 192.10.20.1
```

The available commands for troubleshooting can be found in the topic [Verifying Anti IP Spoofing](#).

14.3.3 Configuring Anti IP Spoofing for all IPv6 addresses

The next steps will indicate how to set the anti-ip-spoofing in service-port-2 releasing only the IP traffic for all the IPv6 addresses.

```
config
anti-ip-spoofing
interface service-port-2
  allowed-ip ipv6-all
commit
```

The available commands for troubleshooting can be found in the topic [Verifying Anti IP Spoofing](#).

14.3.4 Configuring Anti IP Spoofing for all IPv4 and IPv6 addresses

The next steps will indicate how to set the anti-ip-spoofing in service-port-2 releasing the IP traffic for all the IPv4 and IPv6 addresses.

```
config
anti-ip-spoofing
interface service-port-2
  allowed-ip all
```

The available commands for troubleshooting can be found in the topic [Verifying Anti IP Spoofing](#).

14.3.5 Verifying Anti IP Spoofing

Below are the main commands available to check the feature. If the user is at the config level, the usage of the keyword **do** before the command is required.

For more details about commands output, check the **Command Reference**.

```
show allowed-ip
show allowed-ip address <IP address>
show allowed-ip entry-type type
show allowed-ip mac <MAC>
show allowed-ip status status
show allowed-ip vlan <VLAN-ID>
```

14.4 MAC Limit Configuration

The MAC limit is the quantity of MAC addresses that an Ethernet interface can learn. It is possible to configure MAC Limit in interfaces and VLANs.

14.4.1 Configuring MAC Limit on Interface

The next steps will indicate how to set MAC limit for 100 MACs addresses in the gigabit 1/1/3 interface.

```
config
mac-address-table
interface gigabit-ethernet-1/1/3
limit maximum 100
```

The available commands for troubleshooting can be found in the topic [Verifying MAC Limit](#).

14.4.2 Configuring MAC Limit on VLAN

The next steps will indicate how to set MAC limit for 20 MACs addresses in VLAN 3000.

```
config
mac-address-table
vlan 3000
limit maximum 20
commit
```

The available commands for troubleshooting can be found in the topic [Verifying MAC Limit](#).

14.4.3 Verifying MAC Limit

Below are the main commands available to check the feature. If the user is at the config level, the usage of the keyword **do** before the command is required.

For more details about commands output, check the **Command Reference**.

```
show mac-address-table interface <interface>
show mac-address-table interface <interface> | linnum | begin 3 | count
show mac-address-table vlan <vlan>
show mac-address-table vlan <vlan> | linnum | begin 3 | count
```

Legal Note

In spite the fact that all the precautions were taken in development of the present document, DATACOM shall not be held responsible for eventual errors or omissions as well as no obligation is assumed due to damages resulting from the use of the information included in this guide. The specifications provided in this manual shall be subject to changes with no prior notification and are not acknowledged as any type of contract.
